Another method of getting "the drop with the law" on a debtor is to get a judgment and then secure an order for examination in supplementary proceedings, to continue the examination from time to time, the purpose being to inconvenience the debtor who is unable to pay, catch him in default on some adjourned day when he fails to appear and then secure an order from the court to show cause why he should not be "attached for contempt." When this stage has been reached, the vigilant attorney has the "drop with the law" on the judgment debtor and the constitutional provision against imprisonment for debt has about as much practical effect as the Fourteenth Amendment has when a South Carolina Negro offers to vote. The court sentences the debtor to jail for contempt of court, which is, of course, remitted if he pays the judgment by a date fixed by the court whose "dignity" has been assailed.

This method of cashing in on contempt may add to the "dignity of the court" and make people feel deeper respect for the judiciary, but this impression is not sustained by actual contact with those who have suffered from it.

"There are more ways to kill a dog than to choke him to death with butter" is an old saw and the professional collector has found the "contempt" way fruitful of results.

As one reviews the "sporting" uses made of the law, he realizes the fact that there is no closed season for hunting "with the law." There seems to be wisdom in the advice of a wise old cow puncher to "so live every day that you can look any man in the face and tell him to go to."

Don't let the other fellow get "the drop on you with the law" for he may shoot.

The Passing of a Princess

By FRANCIS HOLBROOK PFEIFFER

OLD MARY was not really a squaw. She was a lady—in the best sense of that abused word—a princess of the blood, gentle, generous, unselfish and loyal.

The memory of her is entwined with the earliest recollections of childhood, from the days when she came to "chee house," scouring until the wood paled under her faithful hands. She acted, also, as a sort of nurse to us children, trying to keep us out of mischief, making us presentable after a hard day of play and giving us—when we rushed into her cabin and made demands—unforgettable pieces of wild berry pie with the top crust in strips.

Mary had a royal Indian name which has been forgotten. She was the "consort" of Tom Squiqui, the nominal chief of the Skagits who reflected the waning glory of a dying race—the head of a tribe drawing near to its pathetic end. Tom was not an ordinary Indian either in appearance or bearing. He wore a beard, which is remarkably unusual for one of his race, and he resembled a Spaniard rather than an Indian. No doubt the old Castilian blood of early voyagers on Puget Sound ran in his veins. He was a dark, brooding man but withal, gentle and kind.

Scaring Away the Evil One

FOLLOWING their natural nomadic impulses, Tom and Mary finally moved away from our ranch and on from one camping ground to another, until Mary became seriously ill and was taken to the great Potlatch House down the bay. Here a meeting was called of friends and relatives, to "momack Tumanimus" to heal her.

Out of regard to Mary and to witness this primitive ceremony, we entered, one night, the long, low smoke-filled house. The sides were lined with rush mats to keep out the wind; low bunks ran along the walls; a great driftwood fire burned on the ground in the center lighting the huge posts with their grotesque pictures and crowding the dim, far corners with fantastic shadows.

To my child eyes there seemed to be hundreds and hundreds of Indians huddled in there with the weird firelight playing on their dusky faces and hands, and glinting white lights from their eyes—just rows and rows of faces and hands, all swinging and swaying, as they hammered on cans and boxes, chanting a refrain as old, very likely, as the race itself. This hideous noise was "momacking Tumanimus"—their attempt to scare away the Evil One that caused sickness and was making poor old Mary ill.

Deep in my child heart something responded to that idea, and I was awesomely impressed when Tom left Mary—who was lying on a sort of dais near the fire calm and quite undisturbed by the racket—and went outside into the darkness with his rifle to shoot the devil! I remembered how I hoped Tom would take good aim and finish his Satanic Majesty, because I was very fond of old Mary and wanted her to live. But I was puzzled when told of Tom's untheological aim—shooting *up* toward the stars instead of into the ground!

For all the noise and shooting the devil eluded them. Mary did not improve so Tom took her back to their little log cabin and called a "Boston" doctor. Even then she grew worse, and knowing that the end was near, Tom sent us word that he was taking her back again to the Potlatch House, this time to quietness and peace.

On the shore in front of our house my mother and I stood watching the canoes come down the bay. A large one, black and somber, carried the family and its few possessions, followed by a light, small, graceful craft in which Mary reclined wearily. Tom kneeled in the stern paddling sorrowfully, gently.

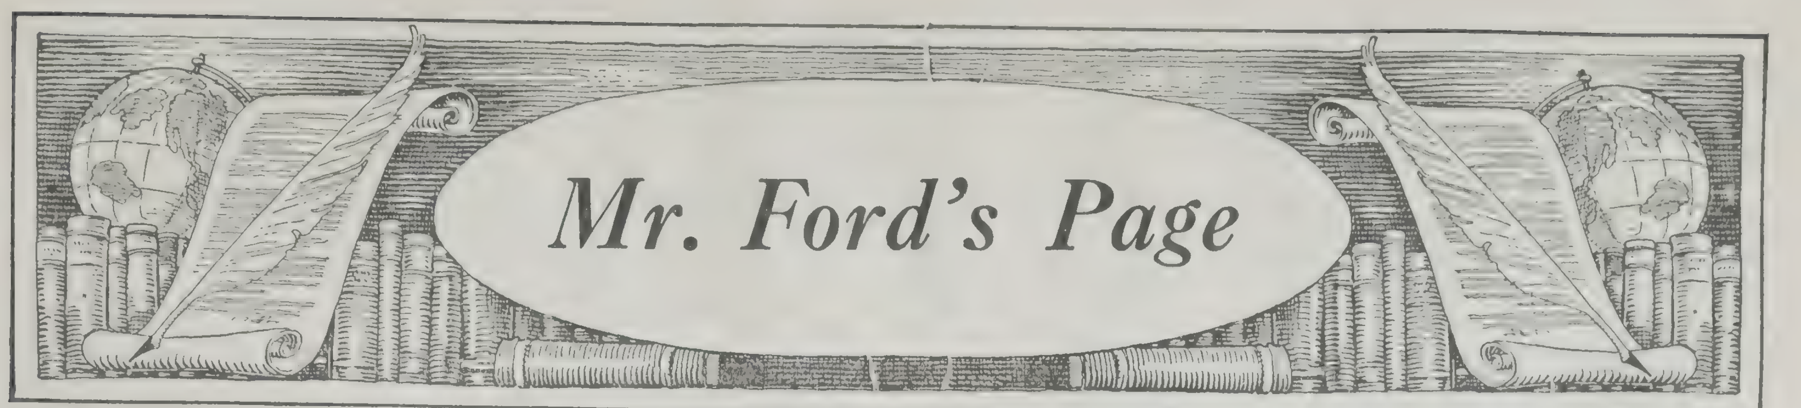
Over the Calm Sea

OLD MARY on her last terrestrial "progress" seemed in truth a princess lying in quiet state. Her face brightened when she saw my mother waiting on the shore. Tom turned the canoe and as the long, gondola-like prow grated on the gravel, mother reached over and clasped Mary's frail old hands—those good, faithful old Indian hands that had served us all so lovingly—and said "Goodby, goodby," chokingly.

After all the years I can still see old Mary's face as she looked that last day. She was only an Indian woman, a heathen. She may have been all wrong about God and the devil and the taking away of "sickness in the midst of them," but from the expression of that dusky, dying face; from the peace and joy glowing on it as she looked tenderly at my mother, whom she loved, and said "Goodby" so hopefully, the Great Spirit could not have been far from this old Indian woman.

Mother turned tearfully away from the shore, but I stood and watched the canoes as they crept along over the smooth water until they were only black, moving specks.

It was a still, summer evening, befitting the passing of the dear old princess.



Mr. Ford's Page

SOME people place a fictitious value on things that are of no importance. If they were very young children this would not be remarkable. In the age of innocence an illusory value is attached to the most trifling things: perhaps a smooth round pebble, a fragment of shell, or a piece of brightly tinted paper.

A little girl collects bits of cloth, broken crockery, and glass beads; a boy hoards up marbles, bits of string, and dilapidated penknives. In these things one sees the instincts of primitive man—the desire to possess that which is of a brilliant hue, which shines or sparkles, or which to the unsophisticated mind bears an exaggerated importance.

Of the intrinsic worthlessness or lack of utility of the objects thus accumulated the child has no conception, although by means of such trifles the little one derives an extraordinary amount of gratification. But this pleasure is innocuous, and parents look on indulgently, and say to themselves that the child will know better when it arrives at the age of reason.

But this does not always follow. The characteristic of extravagantly appraising things that are useless is not peculiar either to children or savages, and sometimes the motive that underlies this characteristic is of a more questionable kind. For example, a man may have a watch which he says he will not part with for "any amount of money." Of course he does not mean this; a roll of bills is sufficient to induce him to part with his treasure, and secretly he is very much pleased with the transaction, for he knows that he has put a false value on the watch that has brought him profit. He knows the watch will not go.

"I wouldn't take a thousand dollars for that dog," another man will declare, but if less than half that sum is forthcoming the dog is not long in finding a new master. It is in reality a worthless cur.

The experience of ages has shown that the only true test of value is usefulness, and by usefulness is meant the faculty of being of real service to mankind.

The setting up of false values when estimating men is even more common than in the appraisal of things. Sometimes one man will call attention to a passing citizen and in substance exclaim: "There is a splendid fellow; one of the most remarkable men in the country." Both assertions may be without foundation. The laudation may be mere sycophancy or the result of a desire to appear broad and generous-minded. In the majority of cases it means nothing at all.

THE circulation of spurious coin is very bad for a community, but the broadcasting of false values is still worse. To detect false currency is comparatively easy; but to search out and eliminate counterfeit values is a much more formidable task, for they lurk where they are least suspected, and possess a luster which hypnotizes reason. The only true test of values, either of men or of things, is that of their ability to make the world a better place in which to live. The only title worth having is that which is built upon merit. If that which has been extravagantly appraised does not assay a fair percentage when passed through the crucible of experience, it will be pronounced a failure. The satisfaction that arises from honest accomplishment is of far more value in the promotion of human happiness than the thrill that comes with the realization of materialistic aspirations.

Titles are sometimes tacked on to men just as labels are attached to goods for sale. A high-sounding designation gives an illusory value to men just as a tag often does to merchandise. So convinced of this have some countries become that they have passed laws forbidding the acceptance of "handles" to names, on the ground that it creates false values in the community which have a detrimental effect on the prosperity of the country.

If a man is not of the true metal, no amount of gilding will make him otherwise. If his standard of intelligence is low no flamboyant title can raise it. Much polishing may make pewter look like silver and brass like gold, but the false luster soon fades. The most skillful horticulturist has not yet succeeded in making grapes grow on thorns or figs on thistles.

Higher values cannot be imparted to men or things by superficial methods. One must go to the heart of things. Bluff is all too frequently the cloak of incompetence. Blunders are often hidden behind a screen of camouflage. There are thousands of "presidents" who never presided over anything, "captains" who know not how to command, and "professors" who are incapable of teaching anything that is good or useful.

But certain titles, whether falsely assumed or otherwise, undoubtedly exercise a fascination over the simple-minded. The more extravagant or fantastic the title, the greater its power over weak intellects. Since the beginning of time quacks and charlatans have been sustained by the very audacity of their pretensions until truth and justice tore aside their mask.

To arrive at true values a spade must always be called a spade and not an agricultural implement. No one can mistake the first designation, but the second is vague and ambiguous. If men and things are not assessed at their true value, social and economical chaos is bound to ensue. Confusion of thought and confusion of action will seriously retard the march of progress.

A practice which has become very popular these days is that known as "boosting." Some people go so far as to boost everything, be it good, bad, or indifferent, merely for the sake of boosting. Whether it is the old home town, or its institutions, or its products, or the quality of the crops grown in the neighborhood, let them all be boosted because it is "good business." But is it good business to go in for indiscriminate boosting without regard to the distinction of value? To raise things up to the highest possible level regardless of merit? No sane person will say so, for the reaction when it comes is bound to be akin to the collapse of a house of cards.

Boosting is an excellent thing if the qualities that are claimed are there to justify it, but without this backing it is but a thing of shreds and patches; a fetish set up for the ignorant to worship. If no distinction were made between the true and the false, the good and the bad, the meritorious and the undeserving, civilization would collapse. It would be the glorification of false values and could only end in disaster. Let us boost by all means, but let the boosting be tempered by honesty and common sense.

The uninitiated have been deceived by the glittering yellow of iron pyrites on a lump of coal, or clinging to the pebbles at the bottom of a clear stream, and have rushed off to tell the world of their supposed discovery, only to find it pronounced "fool's gold." What has been found is nothing more valuable than some specks of iron disulphide. In like manner bits of quartz or rock crystal have been mistaken for diamonds, and fragments of white stone for opals.

The actual value, however, is in the coal, not in the glittering pyrites: it is the dull but flawless rock that the architect and builder selects, not the brittle and unworkable quartz.

Illusory aspirations must also be included in the category of false values. There are people who are still crying for the moon as they did in their childhood; who are chasing rainbows or pursuing gaudy creatures with painted wings that continually elude their grasp. This futility of purpose and misguided energy leads to nothing but disappointment and disillusionment.

The true road to happiness lies not in seeking those things that merely gratify the senses, but those which may serve as solid foundations upon which ideals may be built. True value lies in that which will endure, that which is useful, that which is real, but, above all things, that which will be most beneficial in promoting the happiness of the greatest number.

There is more true gratification in attaining the goal that has been steadily striven for for years, than there is in the accidental discovery of a gold or silver lode. In the one case success has been reached in the pursuit of something the value of which lies in the widespread benefits which it will confer, while in the other it is merely the discovery of something that has been hidden for countless centuries, and which brings into the service of mankind nothing that he did not formerly possess.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Getting at the Source

"IF WE cannot devise a system of arbitration, do not let us fool ourselves that we are going to have peace." In these forceful and direct words the British prime minister, Ramsay MacDonald, the other day gave his opinion before the assembly of the League of Nations. His government, he said, had no faith that military alliances could bring security.

But what is meant by "security"? Mr. MacDonald himself cannot tell. All he is sure of is that it cannot be found in a combine of armaments. There is no doubt that entangling alliances if they are not actually the cause of war are very frequently provocative of it. No sooner do two or three powerful nations come to an understanding as to the pooling of their war resources than two or three other nations become alarmed and go and do likewise. Thus in place of two countries regarding each other with suspicion there may be half a dozen waiting and watching for some excuse to unlimber their guns or send their aircraft on a devastating flight.

There is something sinister about a military alliance. Let every nation take reasonable measures for its own defense—that is merely a precaution—but the piling up of armaments by different nations and then the pooling of the same is far more like defiance than defense. Defiance begets defiance. Mr. MacDonald is right.

The British premier predicted that one day America would enter the League of Nations, and that that day would be when Europe herself had given evidence of her desire for peace. The people of Europe desire peace right now. From the Mediterranean to the White Sea they desire peace; but there are certain troublemakers in every country in Europe who are of a different opinion.

If these troublemakers could be segregated on some international St. Helena it would be a good thing for the world. Napoleon was at one time the troublemaker par excellence, but now the Continent is dotted over with saber-rattling swashbucklers who would fain assume the gray coat and the cocked hat of Bonaparte, but who have not a tittle of his genius. Their only hope is in forming alliances. Every lover of peace must regard such a policy with profound suspicion. Too often the motive behind the instigators of such a policy is not the greatest good for the greatest number, but self-aggrandizement.

If there could be a general rounding up of these pinchbeck patriots the universe would rejoice. This ought to be the prime object of any international league that at present exists or that is likely to come into being in the future. In assigning the responsibility for aggression Ramsay MacDonald has this to say:

"Everybody knows that assigning the responsibility for aggression is the last thing done, and it is always done by historians who write fifty years after the aggression and never by politicians who live through the beginnings of the war."

It seems almost as difficult to get at the cause of war as it is to ascertain the reason for cancer. But unceasing research has shown that cancer can be prevented if certain symptoms are treated in time. It is the same with war.

Wrong Feeding

PROPER nourishment whether of plants or human beings is essential if healthy growth is to be secured. In the case of human beings, however, the mind has to be fed as well as the body, while all that is necessary in the plant is that its physical development be satisfactory. An unhealthy plant will not bear good fruit; neither will an unhealthy human being.

To get good results, it is essential that a plant be fed; but—and this is the important part—it must be fed with the right kind of food. If you feed nitrate of soda to rhubarb, for example, you will have fine big stalks, and if you feed phosphate to tomato plants you will increase their fruit yield; but if you reverse the process and feed the phosphate to the rhubarb and the nitrate to the tomato plant, the substance will be wasted on the rhubarb, while the tomato plant will develop a vigorous growth of stalks and leaves but very little fruit.

It is the same with human beings. It is not the quantity of food that they get that is of the greatest importance, it is getting the right kind of food. Malnutrition in children, and in grown-ups as well, but more particularly in children, is not the result of insufficient nourishment, but of getting the wrong kind of nourishment. Cases in which parents deliberately starve their offspring are fortunately rare, but the number of times they unwittingly give them food which through lack of sustaining qualities brings about the same results as starvation is beyond calculation.

It is not only the body that suffers from wrong feeding, it is the mind as well. The cases in which the mentality of children is irretrievably damaged by being falsely nourished are even greater than in connection with their bodily welfare. "A healthy mind in a healthy body" is the ideal which men have striven for since the beginning of time, and the greatest obstacle to the attainment of this ideal has been wrong feeding.

Leaving the question of *calories, carbohydrates, proteins,* and *vitamins* to doctors and dietitians, let us analyze for a moment the mental pabulum that is handed out to a large proportion of the young people of the present generation. This nourishment is mainly derived from books, oral instruction, and things that appeal to the intelligent through the sense of sight. It follows then if this mental food is to be beneficial that it must be of the right kind; that the books must be good books, that the instruction must be wholesome, and that there be nothing offensive in any form of entertainment.

It will be acknowledged that there is a vast amount of wrong feeding from all these sources. Poisonous literature is broadcast among the young; it is even found on the bookshelves of some of our schools and colleges, and thus tares are sown with the wheat to the destruction of the crop. One of the greatest mistakes is to confuse instruction with education. Instruction may be good or it may be bad, but education in its true sense is that which builds up character; in other words, it is the building up of the mind by using the right kind of food.

An even more sinister influence is found in pernicious picture shows, for these things appeal more directly to the mind than the most seductive books, and their influences are more lasting because they are better remembered. This is an alluring form of wrong feeding in which the effects are more swift and deadly than in almost any other.

Is it not time for a general checking up of all the sources of wrong feeding, and that mental dietitians get together and see what can be done to stop it? Research in this direction is even more urgent than tracing the cause and cure of malignant diseases of the body.

Poland's Timber Wealth

THE timber wealth of any nation may be regarded as the common heritage of mankind. Sooner or later it is distributed in the form of manufactured articles, or in its raw state is shipped from country to country in almost every quarter of the globe. The timber wealth of Poland, which is among the most valuable in Europe, is now to be shared by Great Britain.

According to the Warsaw correspondent of the *Times,* London, a contract was signed last spring by which the Polish Minister of Agriculture granted to an English syndicate a concession for the exploitation of extensive Polish Government forests. The agreement contemplates a period of ten years for felling, beginning in September, and provides for a yearly cut of 25,000,000 cubic feet. Representatives of six countries were negotiators in this deal, which includes "the right to cut the mighty oaks and giant pine trees over a stretch of country which generations of Royal preservation had maintained in a primeval luxuriance." The *Times* further remarks:

"The British success is notable and carries with it valuable consequential results, not the least important of which is the power to direct the exportation of the timber felled. This may well mean that Great Britain will have the preference when the destination of the selected wood of the forests has to be decided, and there is a further prospect that wherever the timber goes it will provide freights for British ships and earnings for British capital."

Chief of the four forests which are to be exploited is the forest of Bialowieza, which lies about 120 miles to the east of Warsaw and has an area of some 360,000 acres. It contains oak, ash, elm, alder, birch and pine.

M. Grabski, the present prime minister of Poland, has initiated a policy of disposing of the various industrial concerns owned by the government, and has coupled with this the acquisition of foreign credit which has aided in establishing a stable currency. To carry out the new system M. Grabski has been granted powers to arrange sales without consulting Parliament, and by the disposal of industrial assets to add to the gold reserve of the country.

Respectable Bootlegging

THERE is a feature of the problem of prohibitory enforcement which strikes one as being worth consideration. It is the enormous demand for proprietary concoctions carrying a large alcoholic content, which, pretending to be cure-alls for real or imaginary ills, are really intended to satisfy the cravings of a diseased appetite for intoxicants.

The liquor habit fed by these alleged remedies, strangely enough, is encouraged by persons who are also strong prohibitionists. It is a lamentable fact that many earnest individuals are the most ready to recommend a "patent medicine." There is little need to name these nostrums, but it is a fact that some newspapers advertise but few others. Imagining the "kick" to be evidence of a restoration of vitality, the dupe of the medicine man will sit down and pen a testimonial that the mixture has cured him after all other remedies have failed. It matters not if the dose has to be repeated in increasing quantity each day until the taker is a hopeless addict.

Carefully edited descriptions of the run-down condition of sufferers "before taking" find hundreds of others whose symptoms seem to them the same. They seek the specific and in the end find themselves enslaved, for it is on the alcoholic content such nostrums depend for any result at all, and such result can be but temporary.

Music Has Charms

THERE comes a story from Arkansas that a dairyman has been able to extract more milk from his cows by the simple device of serenading them with jazz music. Dances are held in the barn and besides affording enjoyment for the dairyman's guests it fills his milk pails in the morning.

That "music has charms" is a trite saying that has been proved from the time that Jubal became the father of those "that play on the harp and the organ." Music has been defined by some as a "series of pleasant sounds," but the idea of what is really "pleasant" in the way of sounds widely differs among the people of various nations, and there is no reason to doubt that taste in music as widely differs among animals. The great thing seems to be to gauge their tastes in this respect. Horses will prick up their ears and prance when a brass band plays, but dogs will howl as if in mortal agony at the same kind of music. It is therefore interesting to note that the cow loves jazz and generously responds.

There was once a poultry farmer in Ontario who discovered this same fondness of animals for certain kinds of music. After considerable research he found that his hens were particularly fond of bagpipe music, so having learned that instrument in his youth he thought he would try its effects in the chicken coop. The results were beyond his wildest expectations, and the egg basket was filled to overflowing every day. It was far better and cheaper than keeping the lights burning all night as some of his neighbors had done with the notion of making the hens work overtime.

The psychological effect of music in various directions is well worthy of scientific research, if only to ascertain its value as an adjunct to farm production.

How China's Submerged Millions Live PART II

Nation's Industrialization Is in Prospect; Awakening Along Western Lines of Effort

By CARROLL K. MICHENER

A member of the beggars' guild.

THE thoroughness of Chinese economy, the laboriousness of individual industry, were such as to oppress us at times with a sense of its futility. We had observed the painstaking thought and care of our friend Farmer Wen concerning each separate stalk of cabbage, from which he picked every microscopic insect. His own ceaseless perseverance seemed actually to have discouraged the swarming persistence of those pests, though at a labor cost that might have been rewarded with far greater return had it been directed toward more remunerative ends.

The opportunity for such increased return from labor was rarely, of course, at hand. China was still in the primitive period of industry that reduced multitudes to seemingly futile avenues of gain. Thousands of men, hale or decrepit, hobbling women, mere children, found a livelihood in retrieving the droppings from animals along the highways and byways. We knew of an aged couple who had earned sustenance for years by sifting coal from canal mud, laboriously brought up in buckets attached to long poles. Swarms of women and children, throughout China, furthered the country's deforestation, which has been going on for centuries, by gathering twigs and roots from the hillsides. Others collected leaves, straw and grass to be marketed as fuel, an entire day's efforts usually yielding but an insignificant fraction of a cent.

Chinese women, we knew, were rarely without some visible occupation; with needlework, the stitching of felt shoe-soles, or the spinning of a reel of cotton. And the indefatigable activity of the coolies in their accustomed business was abetted in whole communities, notably in Shantung, by the spare-time weaving of hair nets for women of Europe and America. There was no fortune to be made in this work, the pay being minute even for gross lots of the finished, inspected product, and an entire day's labor by the most skilled of manufacturers yielded not more than ten cents. But whole armies of clumsy coolies were at it, between regular jobs, while they rested from the burdensome handles of their wheelbarrows. Children had learned to tie the little knots, women in mission churches toiled away at them while they listened to sermons.

This, it occurred to us, was a forerunner of China's prospective industrialization. It was the beginning of mass production to supply the world market with a fabricated article, but still was based on what the economist would have called the "home" or "community" stage, rather than the "factory" stage. The stage of the factory had been reached, it was true, in such industries as iron working, cotton spinning and the milling of flour, but in general China was still in the primitive industrial position of laborious, uneconomical piecework done in the home.

That the nation's industrialization along Western lines would be slow seemed likely; but it would be inevitable. And it was possible that this process would be far more disturbing, far more dangerous to the national life of China, at least for a time, than any other change or chance that had been imposed upon the East by the hurrying West. It was, in fact, a "white peril," more specific and actual than the Orient's "yellow peril." China, without child labor laws, without either the will or the experience to protect itself against the evils of industrial development that go hand in hand with its benefits, had before it the inevitable human wastage and destruction that would come of the change from home to factory work, from village craftsmanship to mobilized industry.

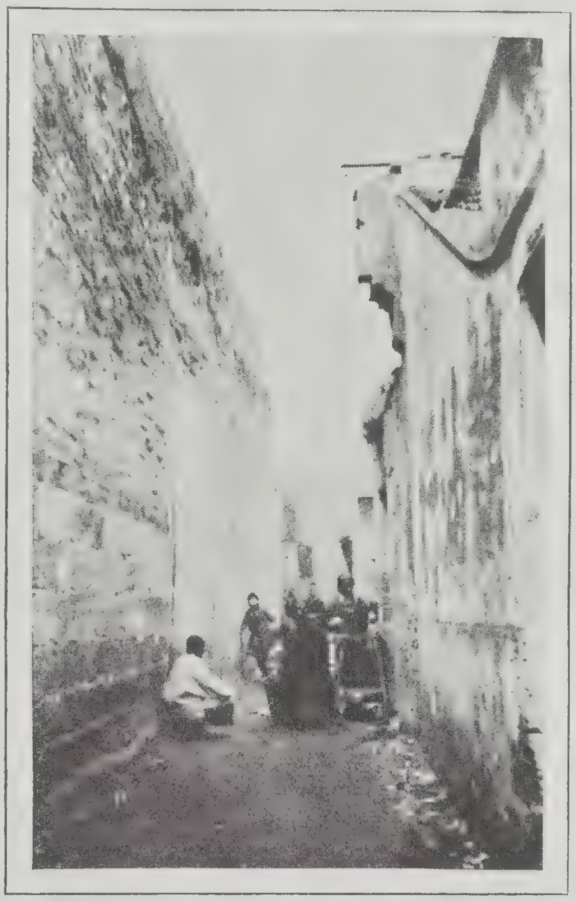
This impending process, we discovered, was being looked upon with an absorbing interest by those whose business it was to feel the pulse of the world's trade. Alexander Hume Ford, director of the Pan-Pacific Union, had been calling attention to it in both hemispheres, from Minneapolis to Sydney. He foresaw a revolution in the course of world trade within the great area between those points, as a result of China's industrialization. The predominance of the Atlantic was to be forever lost.

Not the imminence of great military power, great mercantile aggression, or great political sagacity on the part of the Chinese—it was none of these that constituted the "yellow peril." Immigration bars had stopped the flow of cheap labor westward, but had no jurisdiction over this even greater labor competition. The Chinese coolie, Dr. Ford implied, was still the "yellow peril," but with new and more amicable significance; for China's industrialized laborers would afford a great market both for raw and finished goods and add vastly to the world's productive wealth. Wages would rise to ten times the ten coppers or so that were the average earning of today, and the coolie's buying power, by simple arithmetical calculation, would become many hundreds of millions of dollars a day! Wages of unskilled labor were still miserably inadequate over China as a whole, but in coast cities they had already risen from five to about sixteen cents a day.

China is a country of laborious traffic. Canal and river boats at Shanghai.

Coincident with this industrial development, we had no doubt, would be the growth of a new "class consciousness" in the Orient. The Chinese laborer's place, at least theoretically, had always been high. At the top of the social scale stood the scholar, after him the farmer. Then came the artisan and laborer, with the merchant last. But actually, farmer and laborer had not enjoyed any such distinction as this rating implied. From every material point of view they were at the bottom of the scale.

Among the Chinese themselves, the laborer was held in the utmost contempt. History was silent about him. At best it was a biography of emperors and scholars. The coolie's position was well exemplified by the lowly bearer of burdens, sweating and chanting under the weight of his carrying-pole; and by the rickshaw puller who had sunk from the estate of a man to the status of a beast.



Outside the Old Walls.

But there was already in the air a hint of labor unions. A "strike" of beggars had been mentioned. Students were leaving their classrooms en masse because of real or fancied grievances against either faculty or government. The idea of organized protest was becoming established.

The "Union for the Improvement of Chinese Labor" had been formed in Shanghai, the members being carpenters, masons, brass-smiths and mechanics of various sorts. The object was mutual benefit and protection, including the betterment of labor conditions by placing all trades under the union's jurisdiction. For centuries, said the promoters of the movement, Chinese labor had had no organized body to which it might turn in times of stress, especially where disputes with the employers were involved, and it would be one of the aims of the organization to act as such a body. The main purpose, however, was connected with matters of mutual benefit and protection. Ample provision was to be made for the education of children of workmen by establishment of schools for their exclusive use. Hospitals would also be erected to which only laborers and their families might be admitted. The union would publish a newspaper in the interest of the laboring classes.

This unionizing movement, we were assured, had more than a little connection with the exploit of sending Chinese labor battalions to France during the late war. These men had come back with a new class consciousness, with new ideas and new trades. They had been drawn once more into the obliterating river of population from which they were enlisted, nevertheless theirs would be a leavening influence upon it.

But China had still another and far more fundamental tendency toward labor organization. This was the guild. Craft associations had existed since ancient times, and still flourished in modern China as they had in Europe during the Middle Ages. Every industry except farming, and every craft, appeared to have such an organization.

The origin, it appeared, was lost in the mists of antiquity, though there were semi-historic records during the great Chou Dynasty that flourished a thousand years or so before Christ. In general the guilds were of two varieties, craft guilds and merchant guilds, the former concerned with production, the latter with distribution.

As a rule, the craft guilds were limited to one trade in a single town. The carpenters' guild of Soochow, for example, had nothing to do with the carpenters' guild of Shanghai. There was neither a provincial nor a national association. Details of organization varied, but in general the membership included all followers of a particular craft, masters as well as workmen, within a given district. No craftsman could afford to remain outside the organization. He would certainly be ostracized, and might suffer as much bodily harm, upon occasion, as the "scab" laborer in the United States.

Curiously, the members of a guild were not always drawn from the community in which it was founded. The fishhook makers of Wenchow, for illustration, all hailed from Foochow. No man from elsewhere would be admitted. The needle makers of Wenchow were all from Taichow, in Chekiang, or from the province of Kiangsu. The goldbeaters of Wenchow came from the neighboring city of Ningpo.

Administration of the guilds appeared to be upon a most democratic basis. Committee government was most common. Some guilds went into matters religious and charitable. Most of them, in fact, were under the protection of some patron deity. The carpenters and masons looked to Lu Pan, a well-known artisan of the state of Lu during the halcyon days when both he and Confucius were in the flesh, as their particular saint. Others were under the spiritual tutelage of the god of war, the goddess of mercy, or the queen of heaven, which is to say the moon. The druggists of Wenchow pinned their mercantile faith to Huaton, god of medicine.

Some of the guilds were enormously wealthy, and most of them exerted a powerful influence upon officialdom. They fixed standards of weights and measures in defiance of government edict. The result was a chaotic variation as between one guild and another. They regulated wages and determined the number of apprentices a master might take. Manslaughter had been known to punish an infraction of some of these rules.

But flourishing as this survival of ancient times appeared to be, it was easy to see that in such growing industrial centers as Shanghai, Hankow and Tientsin some weakening of the old order was inevitable. Handicrafts were being injured by the introduction of modern machinery and consequent mass production. Large combinations of capital for investment in factories were separating the master from the workman, and thus disintegrating the guild organization. The

Sapiro and Raisin-Growers

RALPH P. MERRITT,

President and general manager of the Sun-Maid Raisin Growers' Association, who rescued that association from a debt of $18,000,000 and put it on its feet in less than 18 months, by abandoning the original plan of operation of the huge co-operative association.

Why Some Co-operatives Succeed Where Sapiro Plan Groups Failed

Every one of the co-operative marketing associations formerly organized on the Sapiro Plan in the United States either has failed completely, has been reorganized, or is now in a fight for its life against this scheme of exploitation of the American farmer. All have brought heavy losses to their members. The causes for the failure of the Sapiro Plan co-operative associations, broadly speaking, are five in number:

First—Price-fixing, an economic impossibility.
Second—"Orderly marketing," involving inadequate distribution and faulty merchandising.
Third—Bad, sometimes crooked, financing.
Fourth—Incompetence, ignorance and dishonesty of officials.
Fifth—Loss of authority in the management of the associations by their members.

Co-operative marketing associations which have avoided Aaron Sapiro and rejected his plan have succeeded in some instances. Here is the story of one very large association, founded on the plan from which Sapiro drew the details of the plan which he advances as his own, which was $18,000,000 in debt and on the verge of bankruptcy 18 months ago. By the installation of a method of operation diametrically opposite to the Sapiro Plan, this association was saved. This story tells how the job was done.

By ROBERT MORGAN

THE impression seems to have been gained by some readers of this series of articles that the writer believes all forms of co-operative marketing of agricultural products to be failures. Nothing could be further from the truth. While all co-operative marketing associations based on the Sapiro Plan have brought loss, and in most cases disaster, to their members, there are some co-operative associations which seem to have attained success. It is noteworthy, however, that every one of these apparently successful co-operatives is organized and conducted on methods diametrically opposed to those offered by the Jewish ring which is endeavoring to exploit the American farmer. It is further worth noting that such Sapiro Plan co-operative associations as have abandoned that plan, thrown out the managers and other officials installed by the Sapiro crowd, and adopted sane business principles in their distribution and merchandising departments, have attained what would appear to be a successful and sound basis of operation. With the exception of the co-operative *buying* associations, it is too early in the history of agricultural co-operatives in the United States for any investigator to state definitely whether they are or are not destined to have permanent success.

Bearing this last statement in mind, the career of one of the largest co-operative marketing organizations in the world—that of the raisin-growers of California—becomes an important example of the method by which a co-operative marketing association may be made of value to its members.

Women packing raisins in the largest raisin preparing and packing plant in the world, at Fresno, California. No small part of the success with which the product of the raisin growers' co-operative association has been marketed has been due to the attractive packages in which the raisins are offered for sale.

Virtually all of the details of the Sapiro Plan of co-operative marketing were first obtained by Mr. Sapiro from the California Associated Raisin Company, organized at Fresno, in the San Joaquin Valley, California, in December, 1912. Mr. Sapiro had nothing to do with the organization of this company, which, though called a co-operative, was in reality a stock corporation, many of whose shares were held by persons outside the raisin-producing industry. But, with few changes, the plan formulated, developed and used by this raisin-growers' organization furnished the details of the Sapiro Plan. The history of this association is the history—up to January 1, 1923—of the largest co-operative marketing association ever attempted on the plan which has now become known as the "Sapiro Plan."

The raisin-growers gave this plan—the original of the Sapiro Plan, bear in mind—an eleven-year test. At the end of this test, in December, 1922, *they found themselves eighteen million dollars in debt,* under investigation by the Federal Government *on charges of being a trust,* and facing *immediate bankruptcy.* It is not necessary here to go into the details of the reasons for this condition; they form the regular, uniform record of each and all of the Sapiro organizations. Tremendous expense, injudicious advertising, unwise borrowing of money to make advance payments to growers, attempts to fix prices—all the factors of failure which have been shown to exist in every Sapiro Plan organization—contributed to the disaster which overtook the associated raisin-growers of the San Joaquin Valley. These growers were producing nearly 150,000 tons of raisins a year; their product was at a high price in the markets of the world, and their industry was the industrial and financial backbone of the great San Joaquin Valley, yet such were the faults of the plan under which they operated that, though they changed their name, put one of the most prominent raisin-growers in as president, and took other steps, they could not make their association either a commercial or a financial success.

One of the great causes of disaster to the "Sun-Maid Raisin Growers," the organization which had been made out of the California Associated Raisin Company, was the contract with the grower. This contract, made in 1921 during a period of high prices, guaranteed to the grower an advance of four cents a pound on standard goods, and four and one-half cents on extra-standard, an average of about four and one-quarter cents a pound. With the price of raisins—as well as of other foodstuffs—rapidly returning to normal, or near normal, banks and other financial interests could not be induced to advance sufficient money on the current crop to make the payments guaranteed by these contracts. In other words, the association faced a condition in which the market would not finance the business. In addition to this, the management of the association had been such that the growers virtually had lost not only control but even participation in the affairs of the organization. Both these defects are found in every Sapiro Plan association, so that what follows is the story of an apparently successful remedy applied to a co-operative farm marketing association which had met with disaster.

In January, 1923, the directors of the association, elected from the various units or districts, decided to install a management to be conducted along business lines. Ralph P. Merritt, former food administrator for California, and the man who reorganized the all but defunct Rice Growers' Association of California, another Sapiro Plan failure, was chosen to rescue the raisin-growers from their $18,000,000 indebtedness and dispose of a total of 347,000 tons of raisins. Of this tonnage, 100,000 was left unsold from the 1922 crop, while the record tonnage of 247,000 was delivered by the growers in the 1923 crop. Complete reorganization of the entire Sun-Maid Association also was ordered.

The results of this throwing away of the ancestor of the Sapiro Plan, and the installation of a business management in which the growers at all times have the controlling and directing hand, have been a reduction of the debt to $4,500,000 from $18,000,000; sale of 280,000 tons of raisins, with 67,000 tons left on hand to be sold for conversion purposes, and the complete alteration of the methods by which this huge co-operative works. The crop of 1924, it should be said here, will be approximately 200,000 tons, possibly a little less than this amount, and the management of the association believes that with its new merchandising and distribution systems, it will be able to dispose not only of this year's crop, but of the 67,000-ton carry-over from last year. These things have been accomplished in the nineteen months beginning with January, 1923, and ending with August 1, 1924. A more striking example of the results of proper business management of a co-operative farm marketing association it would be hard to find.

Mr. Merritt, after obtaining the approval of the thirty directors, elected by the growers in the ratio of one director for each of the thirty units into which the association is divided, first canceled the contracts calling for advance payments to the growers, who are now paid as fast as the management of the association is paid by the buyers. He next knocked $1,500,000 from the budget for 1923, as compared with the budget of 1922, thereby cutting down at least a part of the high overhead expense. Then, he initiated a campaign to finance the association. After these matters had been attended to, he went through the operating personnel, reduced it nearly one-third, and maintained a standard of work accomplished in return for salaries paid which speedily weeded out still others from the old force.

The campaigns for new contracts with the growers, and for financing the organization required six weeks. The growers, seeing that they had come back into control of their own association, through their directors, readily accepted the sound business principle that they could not expect pay for their raisins until the association itself had been paid for them. The bankers of the communities involved accepted the reorganization plan offered, and have agreed to finance the association to the extent of $10,000,000, half of which is borrowed from the Federal Intermediate Credit Bank, and half from

The first step in the preparation of raisins—picking the grapes and putting them to dry on wooden trays in the sun. Dehydration and other forms of drying have been tried, but none is so successful as the heat of the sun.

Benjamin Franklin as an Ideal Economist

How His Theory Regarding Interest on Money Worked Out in Practice

By J. V. NASH

BENJAMIN FRANKLIN is deservedly regarded as a great man. His "Poor Richard's" philosophy contains many popular aphorisms on how to be healthy, happy, wealthy, and wise. Franklin was interested in many subjects, but there was perhaps no topic upon which he was fonder of expatiating than upon that of thrift, frugality, and saving.

Toward the end of his life, he decided upon a novel demonstration as an object lesson to teach future generations the truth of his precepts with reference to the miracles which might be achieved through saving money at interest. The story is told in a little clipping credited to "Exchange," and reading as follows:

"Benjamin Franklin is our ideal economist. In his will he bequeathed one thousand pounds, or $4870 each to the cities of Philadelphia and Boston.

"Franklin devised that this money, interest and principal, should not be touched for one hundred years. Franklin died in 1790. Consequently, the one hundred years were up in 1890. How much did the one thousand pounds amount to?

"Listen—

"The intent, Franklin explained, was to show the world how much one thousand pounds would amount to in one hundred years if placed at interest and left untouched.

"He calculated that at five per cent compounded annually it would amount to £131,000 or $637.970.

"The result of his bequests to Philadelphia and Boston was that after 100 years Philadelphia had not exceeding $100,000 and Boston had $391,168 68. What became of the balance of the interest? It would take a book as big as Webster's Unabridged Dictionary to tell. The money was loaned on mortgages; fires occurred; lawsuits followed; there were foreclosures. Courts took a hand all along the line. The miracle is that any of Benjamin Franklin's money was left at all.

"There is the experience of two trust funds, presumably under competent, conservative management. One hundred thousand instead of $637,970; $537,970 lost, somewhere."

The Right to Interest

EVEN so shrewd a man as Benjamin Franklin was unable to make the interest system do what it promised.

The great economic error in the interest system is that it is an attempt to get something for nothing through a misconception of the nature of money. The interest system treats money as wealth, *per se,* instead of that which it really is, that is, a medium of exchange, which, so far as practically all of it is concerned, has no physical existence whatever, being the purely mental concept called *credit.*

Aristotle, the father of classified knowledge, perceived the fallacy and injustice of interest. Money, he pointed out, is "naturally barren," and he declared that to make it "breed money" was both preposterous and a perversion of its real function as a medium of exchange.

In ancient times, although interest might be allowed by law in specific transactions, there was always a prejudice against it, and it was not allowed to become a great burden on the people as it is today. The law of Moses specifically forbade Israel to collect interest from persons of that race, although they were free to exact it from the Gentiles. Moreover, no debt could run more than seven years.

Under the Roman law, interest was known by the technical term *usury* (*usura*), which meant simply *payment for use* and had no unfavorable significance. It was the extortion of payment beyond the "use" that brought the word "usury" into disrepute. So dark and sinister a shadow gathered round it that those who practiced the business of usury were compelled to drop the word and adopt from the French an unspoiled word—*interest*—which is rapidly acquiring the same evil reputation as its predecessor.

The Christian church, following Aristotle and the spirit of the apostles, condemned usury or interest-taking as clearly sinful. Laws were promulgated in all Christian countries against the practice, and although in some cases the prohibition was evaded by subterfuges, usury was regarded with horror generally. The usurer became an outcast, and the business itself was relegated to the Jews.

It is significant that even to this day, and in the United States, the right to interest on money has never been recognized in principle by the law. Statutes have indeed been passed in all countries, including the United States, limiting the amount of interest which may lawfully be exacted, but that is all. "The right to interest," says the New International Encyclopedia, "exists only by virtue of such statutes or by agreement of parties, and does not follow necessarily as a legal right from the mere fact that one has another's money in his possession or owes him money by contract."

If interest had any natural basis, surely it would be possible to determine a rate of interest which should measure "use," but this has never been done.

"I am not skilled in accounts," said Martin Luther to the great Augsburg bankers, the Fuggers, "but I do not understand how 100 guldens can gain 20 in a year, or how one can gain another, and that not from the soil or cattle, where success depends not on wit of man, but on the blessing of God."

As Professor Frederick Soddy, of Oxford, has recently pointed out: "There is much making of money, but no making of wealth exchange . . . . The economists confound debt with wealth."

Some economists justify interest on the ground that "money" is productive capital, and the lender of the "money" is entitled to a share in the profits earned. But it is a significant fact that after all these years our friends the orthodox economists are still unable to agree among themselves upon the correct explanation of interest. Professor Carver, in the Encyclopedia Americana, frankly admits that economists "are divided among themselves as to the real explanation." After two thousand years and more, it still remains to be determined just what it is and what is its justification!

Perhaps the most generally held of the orthodox opinions is that interest is a reward to the owner of capital for postponing the enjoyment of it. To carry this explanation to its logical conclusion would be to bring about some ridiculous contradictions.

For instance, it is physically impossible for one individual to consume more than a very limited amount of food, clothing, shelter, or even luxuries. Lord Rothschild could not, if he would, eat $100,000,000 worth of beefsteak for dinner tomorrow or drink up the world's coffee supply. Would the theory apply to him?

Suppose that a man owns 10,000 head of cattle. If, instead of having them slaughtered and trying to eat them on the spot, he sells them and takes their value in money, he is able to obtain interest on the money which he could never have obtained on the cattle. If he had not sold them, he would have been put to the expense of feeding the cattle and sheltering them, and a large percentage would have died on his hands, of old age, long before he could have got round to eating them. Yet, according to the economists, he has, by selling his surplus cattle, practiced self-denial and is entitled to a tribute, in the shape of an interest payment, on the proceeds of his sale.

The great philosopher, Francis Bacon, probably the mightiest intellect of the English-speaking race, in his essay "Of Usury" (that is, interest) says:

"The discommodities of usury are, first, that it makes fewer merchants. For, were it not for this lazy trade of usury, money would not lie still, but would in great part be employed upon merchandising, which is the *vena porta* (entrance vein) of wealth in a state. The second, that it makes poor merchants. For, as a farmer cannot husband his ground so well if he sit at a great rent, so the merchant cannot drive his trade so well, if he sit at great usury. The third is incident to the other two, and that is the decay of customs of kings or states, which ebb or flow with merchandising. The fourth, that it bringeth the treasure of a realm or state into a few hands. For the usurer being at certainties, and others at uncertainties, at the end of the game most of the money will be in the box; and ever a state flourisheth when wealth is most equally spread. The fifth, that it beats down the price of land, for the employment of money is chiefly either merchandising or purchasing, and usury waylays both. The sixth, that it doth dull and dam all industries, improvements, and new inventions, wherein money would be stirring, if it were not for this slug. The last, is that it is the canker and ruin of many men's estates; which in process of time breeds a public poverty."

There seems to be a widely accepted delusion that the more money the people "save," the *more money* there is in existence in the country. A moment's reflection should show the fallacy of such an assumption. If less money were put away, there would not be a dollar less in the total stock; it would simply be in circulation, functioning as a medium of exchange, and passing wealth from hand to hand, thus making everyone more prosperous. A dollar that is hoarded for a year might, during the same period, have passed through the cash registers of a thousand merchants, swelling the volume of business done by each.

No one ever earned a dollar that did not come through being *spent* by somebody else.

Money Is Not Wealth

A DOLLAR hoarded is diverted from trade and from the factory pay roll. The more money there is "saved" at interest, the less money there is available with which to pay interest. And paradoxically enough, saving encourages borrowing, because every dollar *saved* by one man must be *borrowed* by somebody else, if interest is to be paid upon the money "saved." Governments, municipalities, public utilities, business corporations and merchants are encouraged to go into debt to provide "investments" for these enormous "savings," and the investors themselves, through increased taxation and the rise in the cost of living, unconsciously have to contribute to the interest fund!

The ever-growing interest charge is one of the most important factors in the high cost of living. It is a huge tax upon all the wealth that is produced. A greater and greater share of the selling price of every commodity must be allocated to the payment of interest.

This factor in the high cost of living has been strangely overlooked by economists. Yet it is simplicity itself.

If it is once realized that money is not wealth, but merely a medium of exchange, it will be evident that the more freely it passes round, the more prosperous we shall all be, because the nation's money is then working faster and facilitating a greater number of exchanges of wealth, which means that every merchant is doing a bigger business, more persons' needs are being more amply supplied, and all the workers are finding employment because of the increased demand for products and services.

The interest system must from time to time break down, since within a certain period of time the entire income of a country would be absorbed by interest charges, for compound interest works night and day, and within a few generations a single dollar at compound interest would reach an utterly fantastic and incredible figure, if the process went on unchecked.

The interest system, in short, has never been profitable in the long run, because it is based on the quicksands of economic fallacy. As Professor Soddy points out, it places debt in the place of wealth. Modern money is merely a system of I O U's, the gold standard being, in the expressive words of John Maynard Keynes, "as dead as mutton." Money today is merely a claim on wealth, so that any attempt to set it up as wealth itself destroys its legitimate function as money.

Where does the interest system lead great nations? One has only to turn to Europe, and to think of the people who laboriously "saved" money before the war, in the fond belief that they were accumulating wealth. Where are their savings, where is their wealth, today? Both principal and interest have become annihilated through the collapse of the financial systems (based on the so-called "gold standard," be it remembered) in Russia and Central Europe. In France, Italy and other nations on the winning side of the war, money is worth today only a fraction of its pre-war value. Even before the war, money was depreciating in value at an alarming rate, through the rise in the cost of living.

In America the same phenomena, though on a smaller scale, are observable. The purchasing power of money "saved" twenty years ago has shrunk to a mere shadow of its former proportions, and efforts to stop this process by means of "deflation" bring still greater calamities in their train.

The interest system and the gold standard are the Siamese-twin evils of the modern industrial system, and neither is likely long to survive the death of the other.

This Is Radio-Casting Station "H-o-m-e"

Concluded from page 4

that two years before was undreamed of. And what was the result?

Dr. Keigwin received this letter:

"I am a cold-blooded woman and it is a long time since I have been to a Holy Communion service. But I listened in tonight, and I am uplifted and have determined to come back to the fold."

It was one of many messages of approval, encouragement and congratulation. The question in his mind was whether the service was binding, so to speak, but Dr. Keigwin said that ecclesiastical authorities assured him that those persons who listened in were as legally present as those bodily in the church.

Only a few days ago a Kansas newspaper reported that the Sunday radio service was so real to one Hiawatha man that when the announcement came that the offering would be taken he wrote a check and mailed it to the pastor that day. On the other hand, a Canadian boy wrote to an important broadcasting station that his father is Scotch, "and takes the headphones off when the minister announces the offering."

Radio is opening new worlds to invalids, the sick and the deaf. That is demonstrated every day now. The more advanced hospitals have already provided radio facilities, and their benefits are subject, it was learned upon investigation, to the attending doctor's prescription. In other words, no listening in is permitted except under expert direction.

It is a paradise for the deaf, according to their own admission, and persons who had not heard a sermon, a speech or a bit of music for many years are now "hearing" again.

Colonel Coolidge last April walked half a mile to the home of a neighbor to hear his son, the President of the United States, make his address at the Associated Press luncheon. The matron at Teller, Alaska, reported to the broadcasting station KGO of the General Electric Company that she found several Eskimo girls out of bed "with their ears just above the loud speaker, enjoying the program."

The *Bowdoin,* a few hundred miles from the North Pole, with Captain Donald B. McMillan on board, had the advantage of the "big night," lasting several months, during which he heard many amateur stations, setting once what is considered a world's record for short-wave stations when Hawaii was picked up.

An elephant refused to recognize his master's voice. The experiment was carried on last year at the London Zoo, but Indarini, the elephant, paid no attention to the voice of Syed Ali, whose voice the animal had learned to recognize in baby days in India. Dogs apparently are more sensitive in this wise, it is said.

In the animal world the treat comes when song birds join unannounced and unheralded.

Big cities, scattered farmhouses, small towns and tiny villages, but lately linked together by good roads and the motor car, now are further bound together by the comradeship of the human voice and of music.

As one traverses the country, sails rivers or the main coast, one sees networks of aerials, and in most cases in this country every such aerial represents a set which was a labor of love on the part of some man of the house—whether little man or big man. Nor does an antenna-less roof mean lack of a set.

H-O-M-E is a good station for boys to steer by, therefore, and with radio keeping them there parents and guardians cannot give them too much encouragement.

The Metamorphosis of the Country Fair

Emerging From Its Midway Period of Fakers, Freaks and Fat Females

By E. I. FARRINGTON

Entrance to Ohio State Fair Grounds at Columbus.

THERE are country fairs which have never needed a reformation, but they are few and far between. Here and there one finds a fair which has kept itself free from midways, fakers and gamblers. It has made annual exhibitions of livestock and produce which have in themselves been sufficient to draw the crowds. For the most part, though, agricultural fairs in all parts of the country have had a long era of debauchery from which they are now emerging.

A book might be written on the devious methods by which fair patrons have been despoiled. For years bands of tricksters, thieves and sharpers of all kinds have made a happy hunting ground of the country fairs. Until recently the so-called midway, with its fat women, living skeletons, dog-faced boys, snake charmers, artful dodgers and oriental dancers, has been considered an indispensable part of most fairs. Managers believed that they could not draw the crowds without attractions of this kind. It came to be a common practice to make concessions to gamblers and swindlers, although, of course, their real purposes were concealed under names which indicated ordinary games of chance. It came to be the custom, too, for the advance agents of questionable attractions to make financial arrangements which those in charge of the fairs found to their advantage. In time there grew a well-organized system which made it possible for gamblers and confidence men to lay out a circuit covering the whole season, with such details as a specified amount of graft for the local constables and pecuniary tokens to the officials who guaranteed protection.

While the motive tone of the country's agricultural fairs was being impaired as a result of this system, its sanitary features were becoming a common scandal. Hardly a pretense was made of cleanliness in serving the so-called lemonade, ginger beer and other decoctions ladled out from wooden tubs in which a few cakes of ice floated about. For the most part these drinks were synthetic preparations containing practically no fruit. It is true that a few slices of lemon were to be seen floating around in the tubs. Oftentimes indeed a slice of lemon was placed in a glass, but it was invariably fished out again as soon as the glass had been placed back on the table and restored to the tub. By this practice one slice of lemon would suffice for several dozen glasses, being used over and over again. Pink lemonade came into existence largely because some coloring was needed to disguise the fact that fruit was absent.

It was a common thing for the farmer who attended a local fair to be robbed, either by pickpockets or, in more roundabout ways, by the bland, eloquent gentlemen who operated the many games of chance. It was not difficult to single out the farmer with a roll. He would be steered to a nearby stand and would watch eagerly while his newly made friend made repeated winnings, perhaps with the rolling balls or with an adaptation of the roulette wheel. He would take a chance, become emboldened by one or two successes to plunge more deeply, and then realize suddenly that he had been effectively plucked. It sometimes happened that the victim would then be induced to serve as a "come-on" man, on the promise that part of his money would be returned.

Occasionally a young farmer with spirit would start in to clean up an outfit which had victimized him, and it is recorded that on occasions certain sharpers have been obliged to climb the board fence around the inclosure to escape with a whole skin. As a rule, though, the local policemen were friendly to the sharpers and summarily removed any obstreperous visitor.

Naturally a condition of this sort could not last indefinitely. Some years ago it became apparent that the country fair was doomed unless it could be purged of its objectionable features. The better class of farmers was refusing to attend and rowdyism was becoming rampant. Managers declared that the fairs could not be made a success without some form of amusement. This claim has not been admitted by all fairs, but for the most part an effort has been made to introduce clean entertainments as a substitute for the dancing girls and for the wild man of Borneo who ate nothing but raw meat, and who appeared as a very tired colored man when the show was over. There are but few fairs today where the old-time midway, with all its garish wickedness, remains. The gambler has been obliged to seek new fields; the beverages which are served are reasonably innocuous and are offered in clean receptacles. "Hot dogs" and similar dainties are still served in tents and booths, but under supervision.

Horse racing which has always been a feature of the country fair had its period of dishonest and crooked dealings, but is being brought to a higher level. Horse racing as carried on at most fairs today is on the square.

The better class of fairs puts on a series of vaudeville entertainments similar to those which are seen in the theaters, and there has been no falling off in attendance. Indeed, the agricultural fair is as firmly fixed in the life of the people as it has ever been. Some of the great fairs of the country have assumed remarkable proportions. Such fairs as those at Brockton, Massachusetts, Elkhorn, Wisconsin, and Syracuse, New York, have grounds and buildings worth hundreds of thousands of dollars, and hire paid secretaries who maintain offices the year round. One fair is no sooner over than preparations are started for the one which will come a year later.

The University of Chicago has recently held a school for fair management, the first in the country. The meeting was attended by secretaries and committeemen from all over the United States. The titles of the lectures indicate the businesslike basis on which the fairs are now being conducted. Frank Fuller, of Memphis, spoke on "Simplified Fair Accounting," while R. I. Pearce, of Des Moines, talked on "Planning the Physical Equipment," and R. T. Hemphill, of Oklahoma, discussed "The Budgeting of a Fair." Although the matter was not taken up under the head of reformation, those present emphasized the changes which have come over the great fairs of the country. John G. Kent, managing director of the Canadian National Exhibition, said in his remarks:

"The day of the synthetic drink of certain kinds, the decayed hamburger, the unsanitary hash house and the filthy utensil is rapidly passing. Fair officials should see that they never return. Refuse space to the man who will not run a clean establishment."

Eating is one of the big problems in connection with an agricultural fair. Every effort is made to feed the people on the grounds, even though restaurant privileges have to be made free for a year or two. Any marked exodus of visitors at mealtimes is certain to affect the balance sheet detrimentally.

The purpose of the men in charge of the best of the present-day fairs to do away with objectionable features is further indicated by some of Mr. Kent's remarks at the Chicago school. He said:

"Don't hesitate to pull down a man's curtains if he refuses to live up to the strict letter of the law.

"Don't forget that most crowds know that Barnum and his methods are dead.

"Don't forget that the festival spirit makes the public easy prey on fair grounds, and that you are under obligations to protect everyone who comes through your gates against extortion and unfair treatment.

"Don't forget that the strange concessionaire who has no stake in your community will bear watching until he has proved his worth.

"Don't forget that the public holds you responsible for happenings on your grounds; you cannot pass the buck to the concessionaire."

The pageant is one of the newer features of the country fair. Usually it is acted and presented by the people of the community where the fair is held. It conforms to the fundamental purposes of the fair, allowing the community as a whole to have something "on exhibit" in addition to farm products and the like. The great fair at Syracuse, New York, has introduced a rural theater with much success. The acting is done by local talent, and the fact is brought home to the visitors that such theaters can be established in any farm community, even though a barn must be used.

Music has come to be an exceedingly important factor in the development of agricultural fairs. Reports show that last year forty-three fairs spent $250,000 for music alone. Bands and other music at the great Eastern States Fair in Springfield, Massachusetts, cost $8,000.

It is very interesting to note that some of the fairs are again featuring events which were the backbone of such exhibitions many years ago. Plowing matches are attracting much attention. At some of the shows drawing matches by ox teams as well as by horses are also emphasized. The oxen are attached to old-fashioned stone boats, loaded with stone or sand, and the size of the load is increased until only one team is able to pull it.

Most agricultural fairs have been built around the

Firemen's muster at a New England fair. A sane and sensible interlude in the program of "attractions."

livestock exhibitions, and cattle of the finest breed are to be seen even at fairs which are held in large cities. A well-conducted fair offers an unusual opportunity to farmers to become acquainted with the best herds and to buy blue-blooded animals. High-class livestock never fails to draw a crowd.

Agricultural fairs have been woven into the very fabric of American civilization. Washington urged the inauguration of such fairs as early as 1796. The country's first fair was held in the city of Washington in 1804, and lasted three days. Elkanah Watson, who lived in Berkshire County, Massachusetts, has been called the father of agricultural fairs. He secured a petition of twenty-six farmers for a cattle show which was held in Pittsfield, Massachusetts, in 1810. The incorporation of the Berkshire Agricultural Society followed, and this society became the first permanent fair association in the United States. Mr. Watson became so enthusiastic over this success that he was instrumental in organizing other societies, not only in New England but in nine or ten other states. Probably the first state aid for agricultural fairs was an appropriation of $20,000 by the legislature of New York in 1819.

The early fairs were always visited by many prominent men, especially politicians, who took the unusual opportunity offered to address large numbers of farmers. Daniel Webster was a popular orator at fairs in his and neighboring states.

For many years the agricultural fair was one of the most potent influences for diffusing new ideas and in creating an atmosphere of social unity, as well as in introducing better methods of farming and a wider acquaintanceship with blooded stock. The agricultural fair of today serves to some extent the same purpose, although, of course, it has many rivals in the dissemination of such information as farmers require. The agricultural fair has changed greatly in character, but it still serves a useful purpose. For a time it seemed likely to disappear, as a result of disintegrating forces within itself. But with the reformations of recent years, it has taken a new lease of life, and bids fair to retain its hold upon the public for many years to come.

The original purpose of the fair was to encourage the farmers to raise better crops and cattle, and to promote the farming industry generally. This is again their object.

How China's Submerged Millions Live PART II

Concluded from page 9

logical outcome would be, no doubt, a closer association of the latter—in other words, a union of laborers like those of Western lands.

Meantime, China went on with its patient toil—"bound to the wheel" of economic necessity. We grew accustomed to the gruelling labor of the rickshaw coolie, the painful, cheerful struggle of the bearer of burdens, but we could never rid ourselves of the admiration with which we viewed his heroic industry. He had his faults, we knew. These were equally apparent. He was essentially a gambler, a waster of his bitterly gained substance. The Chinese, it seemed to us, was the most inherent, persistent gambler in the world.

This trait surprised us, for we had drawn previous estimates of John Chinaman from those frugal creatures we had known "at home." In the United States those with whom we had come in contact were unobtrusive laundrymen, spitting on collars, and spending their leisure in solemn loafing before their doors. They appeared to have no amusements whatever save tinny phonograph music, no solace beyond tobacco. But this and most other estimates of China, formed with the American Chinaman as a basis, had to be generally revised. The Cantonese coolies of the United States, lifted to new economic dignity behind the counters of laundries and chow mein restaurants, were too Americanized to be any criterion of the real Orient.

From the anterooms and coolie quarters of business houses and residences throughout China there came to our ears the perpetual music of mah jongg. Legal bans and penalties against this and others of the legion of gambling devices appeared to be wholly ineffective. On pay day the adventuresome Wong would possess nothing at all or would have been made temporarily the richer by the pay of his mates.

There was still opium in China, in spite of international treaties and government pledges. Cigarets, through British-American enterprise, had come in unbelievable quantities, and at such prices and in such packets as to make them available to all but the meanest of beggars.

Disease, too, took its toll from the national energy. It would be long, apparently, before China learned the value of man power and was willing to invest in sanitary measures for its increase and protection. It would be long, as well, before labor laws rescued the children of the poor, toiling before their time, from the slavery, actual and economic, that held them in its grip. The slave trade still flourished. It was not uncommon for a parent to take his child to the market, when famine overwhelmed the fundamental humanities. And apprenticeship, even in the legitimate trades, began notoriously too soon. Kindness to children was unquestionably a national characteristic, but work was a child's lot from the time of learning to walk until he faltered at the grave. We were distressed, more than once, at the sight of a child between the shafts of a rickshaw, and another behind it, already on the road to the swift dissolution of cruel overwork.

But these national enervations appeared to effect no great lessening of vitality and enterprise, certainly no diminution of the willingness to work. Labor was the common lot. There were few who evaded it. Even the rich and the powerful went on, under the influence of racial instinct, in the pursuit of more wealth and added power.

We never ceased to find interest and admiration for the shops of artisans and craftsmen. They were everywhere about us, often peripatetic. The barber, with his melodious gong, went by at all hours of the day, as his ilk had been doing, no doubt, since Confucius, with basin slung from one end of his pole and stool at the other. There was the bearded fruit vendor, immobile as a Buddah upon one end of his barrow. The knife-and-scissors sharpener was abroad upon the streets, clashing a bundle of steel pieces to advertise his craft. The vendor of sugar cane and sweets chanted, not unmelodiously, to attract the ear of childhood.

These were but a few of the notes of color and sound in the Chinese street symphony. There was also the squeaking wheelbarrow of the coolie who trundled gangrenous-looking pork from one godown to another; the hoarse shout of the noisome carrier of night-soil; the whining plea of the beggar, with his flattering "Old gentleman lady!" or "Great old excellency!" or the familiar "yang kwei" of the children of the poor, who let no foreigner pass without this request for a bit of money; the loud self-recommendation of the riveter of china, who could make shattered dishes "better than new." Each one of the multitude of street merchants had his own particular cry, many in the singing falsetto that was outgrown in the Western world before the Middle Ages were old.

But there was greater fascination in the streets of the crafts. These were almost invariably huddled together—a street of coffin makers, a quarter of furniture makers, a bird fanciers' alley; streets of goldsmiths, silk shops, jade carvers, lantern shops, tea houses; streets of violin makers, of idol carvers, of bathtub manufacturers, of "spirit-money" coiners whose wares must pay the way of those who have gone to walk with their ancestors beside the Yellow Springs.

There was no limit to this ceaseless, swarming industry; no minuteness and thoroughness for which it would not pause. Lightening the labor, leavening the bitterness of the want that spurred all effort, was the race cheerfulness that made adversity tolerable.

We found the key to this philosophy over the door of a Shanghai guild:

"It is not granted to bewail heaven and earth because of the pain of life; nor to complain when the weather becomes a hindrance unto trade."

Oh, Where Are the Torchlight Processions?

Concluded from page 3

The costly 'sparkling wine,'
But plain hard cider, such as cheered
In days of old lang syne."

With such pleasantries did our great-grandfathers go about the business of electing a President.

Too late in the game the Democrats realized what they had done and sought to undo it. To no avail, they insisted that the talk of poverty, log-cabin residence, hard-cider restriction, was all hokum.

The judgment of history seems to be that Van Buren was an honest, cultured, intelligent and patriotic man, who made a record as President rather better than the average; but, in the light of such "reasoning" as the Whigs used, the result was certain. Harrison, who had taken little part in the campaign, was elected handsomely. His electoral vote was 234 as against 60 for Van Buren, though the popular votes of 1,275.016 and 1,129.102, respectively, indicated the Democrats had put up a fight, anyhow.

The voters may be substituting reasoning for the playthings of politics or they may be just making more these days of comparisons between pre-election promises and post-election performances. The electorate may be contemplating the possibility that an election, whoever is chosen to office, means to it, in the words of Hosea Biglow, only one thing for certain—"their annooal soft-sodder an' taxes." Mr. Biglow's philosophy will be recalled, as phrased by Lowell:

"So they march in percession, an' git
up Hooraws,
An' tramp through the mud fer the
good o' the cause,
An' think they're a kind o' ful-
fillin' the prophecies
Wen they're on'y jest changin' the
holders of offices;
Ware A sot afore, B's comf'tably
seated,
One humbug's victor'ous an'
tother defeated.
Each honnable doughface gits jest
wut he axes
An' the people—their annooal soft-
sodder an' taxes."

From log cabins to teapot domes, from homespun and coonskin to million-dollar fees, from rum euphemized as hard cider to "light wines and beer," how have the voters changed and what are they thinking about?

Are the College Fraternities Dying Out?

Concluded from page 5

in response to an invitation from the Committee on Expansion of the Interfraternity Conference.

Both the conferences are purely advisory and are said to be in no way "super-fraternities." They have no binding authority over any of the national or local fraternities; they do not try to speak "for the college fraternities, only to them." They did draw up certain resolutions looking toward general betterment of conditions.

To the lone local fraternity, the interlocal conference, which will meet annually at New York at the same time delegates to the Interfraternity Conference exchange griefs and experiences, comes as a saving grace. It has been a serious problem the local has faced in the fraternity survival-of-the-fittest race, for it has been no secret that houses belonging to a national chain bid and receive the cream of such college undergraduates as choose to "go fraternity."

To fraternity men in general, the annual conferences spell a new era and the leaders of the nationals look with much favor upon the expansion programs and nationalization of the locals. Interfraternity conferences are comparatively new, the first successful attempt having been made in 1909. As early as 1883 an endeavor was made to get the bodies together in some sort of serious annual meeting, but in 1884 it was impossible to get representatives of ten together in New York. In 1893, at the Chicago World's Fair, a second effort to meet was made. Twenty-five or twenty-six fraternities and sororities met, but did nothing. The matter rested then until 1909.

Fraternities, which, by the way, are indigenous in the United States, are too firmly rooted to be *driven* out of American colleges and universities. They are less secret now than they were when first formed. Too many prominent public men, including such representatives as President Calvin Coolidge, Secretary of State Charles Evans Hughes, and Chief Justice William Howard Taft, have spent their college days in fraternity houses, to permit attacks to be successfully launched against the system.

The fraternities "see the light" in the matter of telling the world what the fraternity means. The Interfraternity Conference committee on publicity sets forth three aims for which they strive, the two most important of which are keeping the college authorities informed of fraternity happenings, and trying to educate the general public to a "fuller appreciation of the fraternity ideals and accomplishments."

Sapiro and Raisin-Growers

Concluded from page 10

a syndicate of California banks, including the Pacific-Southwest Trust and Savings Bank, the Bank of Italy, and the Anglo and London-Paris National Bank.

Membership in the association was increased from 14,000 to 16,500, with 17,000 as the ultimate goal, and the reorganized association now handles ninety per cent of the raisins of California, and sixty-seven per cent of the production of this fruit in the world. At the middle of August of this year, the new management announced the payment to the growers of one-half cent a pound on the 1923 crop, a total of $2,500,000, the second payment made this year. Other payments will be forthcoming soon. The merchandising system of the association has been extended to cover all of the United States, Europe, and much of Asia, where, for example, the Chinese are being taught to eat raisins, and are rapidly accepting them in large quantities as a regular article of diet.

In May, 1923, the most important step in the saving of the raisin-growers was taken. To comply with all the state and Federal statutes, and thus be entitled to the rights accorded by law to agricultural marketing organizations, and also the more readily to attract capital through greater economies of distribution and greater stability of organization, the Sun-Maid raisin-growers were organized into two corporations, each distinct from the other but both functioning together, *under direction of the growers who produce the commodity sold.* The first of these corporations, the "Sun-Maid Raisin Growers of California," organized under the laws of that state, is a non-profit, growers' co-operative association, in which every grower-member holds one vote regardless of the amount of his acreage. The second of these is a Delaware corporation, the "Sun-Maid Raisin Growers' Association," a strictly commercial manufacturing company, functioning under policies and directions defined by the California co-operative corporation. A third, but none-the-less important organization is the "Sunland Sales Co-operative Association," a non-profit organization especially formed for merchandising co-operative products. That is to say, it is the distributing and merchandising department of the "Sun-Maid Raisin Growers of California."

The non-profit organization first mentioned above, at the closing of each crop-pool, prorates the proceeds, less any advances should any such be made, back to the growers, according to the amount, kind and quality of their deliveries. The expenses of the business are first deducted, these expenses amounting to not more than five per cent of the selling price of the crop, as compared with twelve to as high as thirty per cent in the Sapiro Plan co-operative marketing associations previously discussed in these columns. Under a provision of the association's contract with its members, the association has the option of making part payment to the grower in the capital stock of the Delaware corporation, at not to exceed four dollars a ton. By this provision, it is possible to provide for future financial needs by making this small fractional part of the total payment in capital stock. If, for example, raisins net the grower $100 a ton, the four dollars withheld in cash and paid in stock is negligible to the grower, though it is of vital importance to the association in building up a reserve. When the total crop averages, as it now does, 200,000 tons a year, a reserve of $800,000 can be laid aside annually, if necessary. Meanwhile, the growers draw dividends on their stock in the Delaware corporation, one dividend having been declared at the middle of August to the amount of $350,000.

The "Sun-Maid Raisin Growers' Association," the Delaware corporation, was organized to perform, on behalf of the "Sun-Maid Raisin Growers of California," the manufacturing and commercial functions incident to the marketing of the raisin crop. It neither owns nor holds title to a single raisin; therefore, it makes no advances on raisins to the grower. It serves the California co-operative association of growers under a contract, which provides, in general, that the duties of warehousing, processing, advertising and selling of raisins *shall be performed under the policies and directions defined and issued by the California co-operative association, that is to say, by the growers themselves.* The contract provides that this Delaware corporation shall receive from the California organization as compensation the cost of these operations, and the dividends on its outstanding seven per cent cumulative, non-assessable, preferred stock. In actual practice, after the costs of operations and dividends have been taken out of the proceeds of sales, the balance is remitted to the California corporation for distribution to the growers. The common stock of the Delaware corporation is held by the California co-operative association, that is to say, by the growers of the raisins.

Something About Organization

THE old California corporation—prior to the time when the present modern business management was installed—was a commercial, profit-taking organization, *with its stock held by both growers and outsiders.* In the reorganization process, the new California co-operative corporation is a legally constituted co-operative association, composed solely of growers, each of whom has one vote, regardless of the acreage he may own. The functions of the California corporation, in general, consist of maintaining contacts and relationships with the growers; containing contracts and deliveries of raisins; arranging for and making such advances to the growers as may be necessitated by delivery of the raisins in sweat boxes fresh from the drying trays in the vineyards; supervising the efficient and economical fulfillment of the service contract with the Delaware corporation, and receiving from the latter the net proceeds of sales and distributing them to the growers. These functions are administered through departments assigned to the controller and to a growers' service division. The growers indicate their wishes and express their ideas through a system of thirty locals or district organizations, each of which has a representative on the board of directors. The president and managing director, one and the same person, is directly under this board of directors, a system which makes the raisin-grower supreme in his own association, a position he never occupies in any of the Sapiro Plan co-operative associations.

To revert for a moment to the Delaware corporation—the Sun-Maid Raisin Growers' Association:

This organization exists solely for the purpose of performing for the California corporation various purely commercial functions, with maximum economy and efficiency. It acts for the account of the growers' organization, which stands responsible for the cost of the operations of the Delaware corporation, and for the dividends on its seven per cent cumulative, preferred stock. The Delaware corporation, in its legal aspects, embodies the most modern and best approved practices utilized by commercial corporations of large size.

To preserve for the Sun-Maid Raisin Growers of California the rights guaranteed to co-operatives in the selling of their products, and for further reasons of economy, the actual merchandising of Sun-Maid raisins is done by the Sunland Sales Co-operative Association, a purely co-operative selling agency. Its relationship with the Sun-Maid Raisin Growers of California is maintained by a contract with the Sun-Maid Raisin Growers' Association (the Delaware corporation) under the terms of which Sunland has taken over Sun-Maid's world-wide selling organization, and now performs the merchandising functions incident to the distribution of Sun-Maid products, under policies defined by the California corporation, that is to say, again, *by the growers.*

A Plan With a Difference

TO COMPLETE this history of the reorganization, and to clear all sections of the field for action, the new management requested the Federal Court to appoint a trustee for the purpose of formally and officially closing out the business of the old organization which had plunged itself into bankruptcy, meeting its obligations, and distributing its assets. Milo L. Rowell was appointed as trustee, on December 26, 1923. The general result of the reorganization of this group of more than 16.000 agriculturists is the creation of a legally sound, non-profit, co-operative farmers' organization, with all the rights of such an association, *which is really controlled and directed by the growers themselves.* It has further created an apparently efficient commercial corporation, equal, legally, financially and in administrative management, to any business competition it may meet, with the added factor of a sales agency equipped to do business in all parts of the world at what seems to be a minimum of expense and a maximum of efficiency.

Men who are familiar with the production, processing, distributing and merchandising of raisins are in executive positions in all three associations, or corporations, and the entire establishment is under the control of the men who produce the raisins. Once a year, at least, the head of the association, Mr. Merritt, makes a tour of all thirty of the district locals, meeting all the members, reporting to them, and explaining the report to them.

The difference between this plan of operation of a co-operative farm marketing association and the Sapiro Plan, whose disastrous history has been described in previous articles, is explained by the president of the Sun-Maid organization as follows:

"The old idea, prevalent in co-operative farm marketing circles, that the grower could charge any price, plant any acreage, distribute his product when, where and to whom he pleased, and violate any laws, either state or Federal, must be eliminated, if the co-operative is to succeed. The co-operative farm marketing organization must be put on a sound, modern, capable, business basis. When I came into this organization I found that no one knew the facts concerning its inside operation; no one knew what it would be to operate the association on a business basis, because the price of its product always had been on the up-grade, and the whole organization had three vital errors:

"First, the error of the contracts with the growers, guaranteeing a fixed amount of money in advance.

"Second, the lack of adequate capital, so that it could not work to maximum capacity; I found that while the total investment was $6,000,000, it did not have this much capital, so that the money of the growers was literally 'frozen' much of the time.

"Third, the association was operating in violation of the law because it was a corporation with stock, and therefore was not a growers' co-operative organization. In fact, it had slipped away from the growers because of the voting power of the stock held by outsiders.

"Added to these was the further fault that the association, during the period of high prices for raisins, never had kept its contract with the growers, who had little or no voice in its management.

"The plan on which it has been reorganized in brief is:

"First, reformation into a real co-operative association, complying with the law, and giving the growers back their control.

"Second, the doing away with the old contract with the growers.

"Third, the provision of adequate capital. This capital has a maximum of $20,000.000, but in actual practice only about $9,000,000 is being used.

"We have changed our method of approach to the public. Wasteful and resultless advertising methods have been altered, and we have built up confidence on the part of the public in the grower, and on the part of both public and grower in the association. *Price-fixing has been made incidental to the merchandising of the product.* We have found it necessary to set a price, after long study of the supply and the demand, not because the grower wants a fixed price, but because the buyer wants to be assured that the price will not be lowered until he has had a fair opportunity to sell the raisins he has bought at an honest profit to himself. There are three factors which work at all times against price-fixing, and which make it inoperative:

"First, the competitive levels of any one commodity, and the relations of these levels with general commodity levels in the markets of the world.

"Second, the variation in buying power of the consuming public.

"Third, the volume of the commodity which either producer or association of producers has to dispose of. A heavy surplus and a heavy carry-over are *prima facie* indictments of the management of an association.

"These are the points on which the price of any agricultural commodity must rest.

On a Business Basis

"WE HEAR a great deal about 'orderly marketing.' Distribution is the largest factor in this, as it is in other merchandising, and, technically, the only actual 'orderly marketing' is the sale of a product at a reasonable price where there is a demand for it. There are, indeed, two points which I would emphasize in regard to any co-operative farm marketing association. One of them is the fact that a co-operative marketing organization, in practical operation, cannot always get for its members more money than the producer of the same commodity outside the association, because the outsider often, in fact frequently, gets the benefit, without cost to himself, of co-operative advertising of the product. If an association controls ninety per cent of a crop, the remaining ten per cent may get a better price than the ninety. Yet, this year, without the association, the raisin-growers of California would be getting half a cent a pound for their raisins.

"The second fact I would like to impress on all co-operatives and on all students of co-operative marketing is that no co-operative association can be built from the top down. It must get its power either direct from the members, out of contracts with the members, or by superior force of the management and the outside owners of stock in it. The value of a co-operative marketing association arises solely from the willingness of the membership to work together on a common problem for the common good. It is no place for enforced management, no place for politics; it must be operated purely and honestly as a business, on a business basis.

"Some idea of the size of the business involved in handling ninety per cent of the raisin crop of California, and sixty-seven per cent of the raisin crop of the world may be gained from the facts that the total grape area within the association is 300.000 acres, valued at $200,000,000, with approximately 200,000 persons dependent, in part at least, on the industry. The properties owned by the association are valued at $6,000,000 and it employs more than 4,000 workers."

Cancer Prevention: A Warning

Concluded from page 2

We conclude this article by the following important warning by Dr. Bloodgood on a form of cancer which is all too common at the present day.

Down will go the death rate from cancer of the breast in women, as recorded by the U. S. Bureau of Census, as soon as women learn the lesson of quick action.

More than 75 per cent of women with lumps in their breasts will find that they don't have cancer at all, when they consult their family physician immediately on discovering the lump, one large clinic reports. If the lump does prove to be cancer, more than 70 per cent of them, when early attention is given their trouble, will have a chance for a permanent cure.

Nature warns women of this great danger in time, but they need special instruction to act in time. The danger of a lump in the breast, if the lump is cancer, is delay. If it is not cancer, there is no danger, but one never knows, without medical advice, whether the lump is cancer.

When a woman feels a lump in her breast, she should go at once to a good doctor. It is likely that the lump she feels is not a definite tumor; very probably it is only a part of a lumpy breast, and she will be told that it is harmless and that no treatment is necessary.

But if the doctor finds that the lump is a real tumor, he will seek at once the advice of a surgeon, and an operation, which will in no way endanger life, will be performed. If, on the operating table, the surgeon finds that the lump is not a cancer, he will remove the lump only and the breast will be saved.

On the other hand, if the lump is cancer or is even suspicious of cancer, the entire breast and some of the surrounding tissue must be removed. This saves the life of the patient.

Nor is the lump the only evidence of trouble in the breast. A woman had better seek her doctor's advice for any unusual condition, such as an irritated nipple, a discharge from the nipple, a pain, hardness or fullness of the breast, a dimple or an area of redness in the skin of the breast.

This is preventive medicine and, if it does not prevent, it will lead to a chance of cure.

Sunday School Teacher—Secretary of Navy

Judge Curtis D. Wilbur's Wonderful Social Welfare Work in San Francisco

By WILL B. LINDER

“‘THE Chief Justice of California's Supreme Court,’” (We are quoting from the *Literary Digest* of March 29, 1924), “said the Sacramento *Bee*, concerning the appointment of Judge Curtis D. Wilbur as Secretary of the Navy, ‘is a well-meaning but intensely narrow and prejudiced individual who has divided his attention between teaching a Sunday school and writing Supreme Court Decisions. His fitness for any Cabinet position is practically nil.’”

That seems rather severe against our “Sunday school teacher Secretary of the Navy.” But the Springfield *Republican* states a somewhat different view:

“Everything one reads about Judge Wilbur tends to deepen the impression that he is an exceptionally able man of loftiest integrity who will strengthen the Cabinet both intellectually and morally. A jurist does not necessarily make an outstanding executive, but at just this time Judge Wilbur's high standing as Chief Justice and *also as a churchman* (the italics are ours), in the communion of Congregationalists will count as an asset in his favor. His long experience on the bench will add to the legal strength of the Administration which, aside from Secretary Hughes, is singularly lacking in legal training.”

Judge Curtis D. Wilbur bidding goodby to his San Francisco Sunday school's “Executive Chairman,” the Sunday immediately following his appointment as Secretary of the Navy. The stars in the background are part of Admiral Simpson's Navy Jack, loaned to Mrs. Swain for that last Sunday school meeting. It was a surprise for the judge.

As chairman of our own country's Near East Relief Committee, Judge Wilbur certainly has his “hands stretched across the seas,” in a very material way. But it does not seem inconsistent that a *churchman,* as a man of peace, should have approved of President Harding's Peace Conference. A corner policeman is a peace officer, not a peace disturber, and why should not the Chief of Police of the Seas also be a man of peace?

Standing at the head of his Sunday school class the Sunday following that already historic message calling him for the Navy portfolio, Judge Wilbur did not tell us the Navy should be paraded around the world with a chip on its shoulder; no. In his simple, almost boy-like talk—his talks are always heart-to-heart talks—this big, six-foot-three man of wonderful physique, youthful at fifty-seven, said:

“Already I have been asked many times to state my policy as to the Navy. You know I got my education at Annapolis, that I know the Navy. Though it is a good place for our boys it can be made better; and if I may here state a policy to you, it is that I pledge myself to try and make the Navy a better place for our boys.”

As the churchman, of course, Judge Wilbur was speaking particularly of the moral and spiritual atmosphere of the Navy.

It does not require much acumen to surmise that there must have been good blood, as well as ideal American training, behind such a man as Wilbur. We put the query to Secretary Wilbur's brother, Ray Lyman Wilbur, president of Stanford University. He replied:

“My father and mother settled in Iowa during pioneer days, father having graduated from the law school of the University of Michigan after his return from the war. The new community was mostly made up of excellent people from Ohio. The family grew up in the life of the small town of Boonsboro. My mother, who was a graduate of Lake Erie Seminary, was a woman of fine religious strain. When Curtis was of high school age, we moved to Jamestown, North Dakota, where the Northern Pacific had opened up that part of the United States. He was dependable and had a definite religious turn. He always took an interest in Sunday school and Bible study, and had the greatest interest in wholesome themes.”

So that this man's rise to fame may be compared to the long, circling swing of a pioneer's drover whip, culminating in a final pistol-shot snap—Boonsboro, Jamestown, Annapolis, Los Angeles, San Francisco, Washington!—Washington! that final snap that whipped him across the continent and into the President's Cabinet.

Said an old San Franciscan to the writer, not long since: “Before I came to this country I was a wandering sailor. All European shores and their people were familiar to me; I knew their traits, their various characteristics; but when I landed in this country, here I found a very different class of people, a people of higher moral and religious character, of loftier ideals. I found them all the way as I slowly worked from farm to farm and village to village across the continent. And I found the Bible occupying a conspicuous place in the ‘parlor’ of practically every one of those homes. But now it is seldom seen in any home, and we are breeding a nation of *rats!*”

That is harsh, but it pictures well the kind of people and community from which the new Secretary of the Navy sprang.

Of how Curtis D. Wilbur passed through the Naval Academy with high honors, came to Los Angeles and there taught school, took up the study of law, became lawyer, Judge, Superior Judge, then Chief Justice of the California Supreme Court, which high position he was fulfilling when he was called to become Secretary of the Navy, much has already been written. The main object of this article is to aid in fulfilling an ardent wish he often expressed, and of which he again spoke on that last memorable Sunday morning in class. But we will come to that later.

Curtis D. Wilbur has always been somehow connected with Sunday schools, and politics has never made any difference. When he was called from the Superior Judgeship to Los Angeles County to be Associate Judge of the State Supreme Court in San Francisco, it meant leaving his Young Men's Sunday school class of the southern city. Nothing was more natural than that he should soon establish another class in San Francisco. And this he did in the First Congregational Church at Post and Mason streets, right downtown.

But Judge Wilbur's new Sunday school class was founded on an idea growing out of his own life observations. A jurist early learns to see through the outside veneer of things. That is why he eliminated all sectarian bars to his public welfare class in which people of all beliefs and no belief meet together for the common good. The executive chairman, Mrs. Minerva Swain, tells us there is not at present another such a class in the world.

Here he was, a busy judge, spending precious spare week-day hours preparing his Sunday school lesson, or lecture, coming to the classroom early each Sunday morning, bearing with him a load of reference matter to be greeted for a time with staring empty seats. The average of class attendance later became more than a hundred. But “two or three gathered together” never daunted Judge Wilbur; promptly on the minute he would begin his lesson, or lecture, with apparent full faith in the “two or three.”

But the judge's connection with the State Supreme Court soon began to call him to other parts of the state. So he must needs have some one to manage the class and secure speakers in his absence. For this position an excellent woman, Mrs. Minerva Swain, was found.

During the World War Mrs. Swain wore captain's insignia in the United States service. And now, aside from her office duties as notary public, she devotes so much time to the church itself and Judge Wilbur's class that she is called the “Mother Superior of the First Congregational Church.”

Thus Judge Wilbur's Sunday school class goes right on as he wished, though he is no longer able to attend. It is still to continue under the name he chose for it, and why not? It is his own plan, his own idea.

Every week the Church Bulletin continues to carry a card similar to the following:

> “Judge Wilbur's Public Welfare Class
> Meets in the Ladies' Parlor every Sunday morning at 9:45. Devoted to Community Welfare on the broadest lines. Visitors cordially invited. On Sunday, April 27, Captain H. W. Cochrane will speak on ‘The Advancement of Americanization in the Far East.’ Captain Cochrane is returning to the Orient after a brief stay in this country.”

“But *is* Judge Wilbur *really* a Christian?” we were asked.

The first Sunday after his election as Chief Justice of the State of California, our Sunday school teacher judge, standing before his class, in a voice of deep emotion, said:

“I thank you all, for whatever your part in helping to elect me Chief Justice of our Supreme Court. But I thank God for the trust—for the good I may be able to do.”

One of the good things, so thinks the writer, that Judge Wilbur was able to do while holding that trust was in assisting a decision by his court to the effect that it is not unlawful for California school trustees to purchase a Bible for use in their public school library, thus reversing all other former decisions of the state courts.

That decision, by the way, was another matter concerning which the Sacramento *Bee* bitterly condemned Judge Wilbur.

Judge Wilbur, it may be said truly, has a strong leaning toward the humanities of life. He is the very opposite of “narrow,” as evidenced by the nature of his Sunday school class, as well as by his over-sea charity connections. Perhaps his Near East relief work has been brought closer to him by the loss of near and dear friends over there, in that service.

As to the judge's charity work here in San Francisco, there is one little incident that will give the reader a peep right down into his big heart:

Think of the Chief Justice of a great state, his wife in his car with him, hurrying on his way to an important committee meeting. He is intercepted by Mrs. Swain, a charity worker; she tells him of a certain soldier, sick almost to death in a distant hospital of the city, and in need of immediate help to execute a certain legal document, which is vital to him—to his peace of mind. But this soldier is penniless, utterly unable to pay, and he may pass to the beyond before another day dawns!

The busy Chief Justice hesitates: it is already evening and he is thinking of his impatient, waiting committee; but his decision is quickly made: taking up the charity worker, Mrs. Swain, in his car, he wheels about and speeds miles in the direction opposite the meeting place of his waiting committee.

At the hospital, after attending to the dying soldier's paper, and with the grateful sufferer's hand still clasped in Mrs. Swain's, this big, kindly man kneels there in the bare hospital ward and asks Divine guidance for the sufferer.

Speakers and other workers for the welfare class give their services free. It might not work so in every place, but here not even a collection is taken, except, rarely, for some special purpose.

And thus Judge Wilbur's Sunday school class continues. On Easter Sunday morning his little class was in session here in San Francisco at the same hour that its organizer was addressing a sunrise audience of thousands at our nation's capital.

The judge often expressed the wish that his Public Welfare Class idea would spread throughout the land, for the good it might do, this Sunday class in which people of all creeds and no creeds, and rich and poor rub shoulders together in the interest of the common good. Though his class was composed of individual members of all isms and creeds and sects, and of rich and poor, he knew none of these, recognizing no distinctions; or does the class profess any political faith. All these artificialities create dissensions in the class; they prevent and disrupt natural friendships. A near ideal was approached in our community team work during the World War.

The object of the Public Welfare Class is this teamwork, in the interest of community and general public good. It may be expressed in art, in scientific studies, in literature, on all questions both material and spiritual. It impartially hears all sides of any or all questions but insists that each individual, without prejudice, be allowed to form his or her own conscientious conclusions.

Judge Wilbur himself, among his various other lectures, followed up a series on Jesus: “Jesus the Lawyer; Jesus the Judge; Jesus the Citizen,” and so on.

But of all our speakers—and I believe the Wilbur class, as a whole, will concur in this—we loved best to listen to its founder. And there was a reason for that, outside of the fact that the judge, being well learned, discoursed well on most any subject: he spoke as a friend, a brother. And in his going we each felt a great personal loss.

There, before us at the close of class on that last day our teacher stood. He was Secretary of the Navy now. His tone was touched a little with emotion as he said:

“I see here before me this morning many of the same earnest faces that I have seen here Sunday after Sunday during the months and years since first our little class was formed. You have come here, rich and poor, week after week, rubbing shoulders together, seeking truth in the interest of the common good, of the public welfare.

“I don't know whether I am speaking the exact truth when I say, ‘I love you all’; but that is the way I feel about it.”

As always was his custom he dismissed us thus:

“Now let us close with the Mispah Benediction: ‘May the Lord watch between me and thee, when we are absent one from the other.’”

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

United States Controller-General McCarl has ruled that a married woman employed by the government must use the surname of her husband when she signs the payroll. "The law of this country that a wife take the surname of the husband," he says, "is as well settled as that the domicile of the wife merges in the domicile of the husband. She may have an assumed name, but she has only one legal name."

Brigadier General Charles G. Dawes was born in Marietta, Ohio, in 1865.

An eighteen-year-old speeder in Los Angeles was sentenced by the judge to read every newspaper in the city each day for six months and rewrite in his own handwriting the traffic-accident stories in them.

Registration cards are handed to tourists availing themselves of the free tourist camp at Chippewa Falls, Wisconsin, with the request that they set down the number of nights spent at the camp and the amount of money they expended in the city. Figures for July show that the encamped tourists left an average of $166.80 a day or $4,060.70 for the month with the business men of the city.

Elephants are fond of the water and swim with ease and skill.

Archeologists claim there is a striking resemblance in the face of the modern native of Guatemala and those stone faces found on the ancient monoliths of that country.

Kentville, Nova Scotia, plans to erect a monument to Longfellow, who immortalized the Acadian country by his poem, "Evangeline." The movement is to be a joint effort of the people of the New England States and the Maritime Provinces.

The common larkspur, growing in the mountains from Colorado westward, is very poisonous to cattle, particularly just before blossoming time. Only cattle die from larkspur poisoning. Horses do not touch it when left to themselves, and sheep seem to thrive on it.

A wealthy citizen of Milan has purchased the famous Borso d'Este Bible which was produced in the fifteenth century. The parchment for this Bible was made at Bologna, and the artists were employed seven years. The ornamental borders are a fantastic mixture of animals and flowers in color.

More than forty thousand miles of hard-surfaced road were built in 1923 in the United States.

On next New Year's Day, the name of Christiania, capital of Norway, will be changed to "Oslo." There is now a suburb of Christiania called Oslo which was founded by Harald Haardraade in 1050.

A secret ink has been invented in Italy which makes it possible to print advertisements on bread without affecting its edibility.

Half a billion dollars is being spent every year on foreign travel by Americans.

Great Lakes freight boats have lost one-seventh of their carrying capacity because they cannot load so deeply as formerly. Something has lowered the lake levels.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The common desk telephone is made up of two hundred and one parts.

The milk companies of Cincinnati lose 5,000,000 milk bottles annually.

Mexico claims the world's largest tree, a huge cypress at Tule, in the state of Oaxaca. This tree measures 154 feet in circumference. The California big trees grow higher, however.

A heavy blast fired in a stone quarry in Central Pennsylvania blew a hole in the bottom of the rock and struck a spring, which in twenty-four hours made a lake approximately four hundred feet wide and from five to seventy feet deep.

Crabs, lobsters, shrimp, oysters, clams, and other crustaceans and mollusks are both a preventive and a cure for goiter, according to the executive secretary of the United States Fisheries Association. High iodine content in these classes of marine inhabitants renders them particularly valuable for this treatment.

Oriental rugs, woven in a score of refugee camps on native wooden looms, are now on their way to New York from Armenian and Greek child refugees in Palestine and Greece. They are for exhibition in New York City during the Christmas season and are an expression of gratitude from these children.

The Kimberly diamond fields are well guarded. Each mine is fenced in and the inclosure is roofed with fine wire to prevent the native laborers from throwing diamonds over the fence to confederates on the outside. No boots, shoes or other hard materials may be taken out—only clothing which has been minutely searched.

Licenses to build power dams on the Klamath River in California are granted only on condition that the Bureau of Fisheries approves the plans.

Rum boats operating in Puget Sound on the Pacific Coast are now equipped with seaplanes with radio outfits for observing the location of Federal agents and revenue cutters.

"Corn on the cob" has appeared in Paris.

One hundred and thirty busy streets of the city of New York have been closed to traffic this year to provide informal playgrounds for the children of the neighborhood.

The proper method to estimate the range of a radio receiving set is to see how far the set can receive signals in the daytime, between 11 o'clock in the morning and 4 o'clock in the afternoon. Stations that can be picked up regularly between these hours are the ones upon which the receiving range should be based.

A salmon caught at sea off the coast of Alaska and tagged with an aluminum tag by the United States Bureau of Fisheries was later recaptured as it entered the river in Kamchatka in which it was hatched. It is two thousand miles from Alaska to Kamchatka in Asia.

Fashionable long, heavy pendant earrings are drawing women's ears out of shape, according to a noted Paris specialist.

Officials of the Bank of Millstadt, in Millstadt, Illinois, are said to have taken unusual precautions, inaugurating a "safety-before-business" policy. Persons having business in the bank are required to rap for admission. After the cashier has satisfied himself as to the identity of a patron he is permitted to enter.

A school for prison officials is to be opened in Peking as part of a general preparation for the coming of the judicial commission to investigate China's fitness for assuming authority over foreigners now vested in foreign consular courts.

A German diver in a new diving apparatus went down to a depth of 459 feet. At this depth he could see about eighteen inches, a further sixty feet resulting in total darkness.

The Soviet authorities have prohibited the importation into Russia of books about ants and bees in which "queens" are mentioned. They object to the description of colonies of these insects as helpless when lacking the ruling power of their queens.

Human hair is being used in London by some women to decorate their coat collars, cuffs, and blouses, according to a dispatch from that city.

The "Circuit Rider" is represented in a statue recently placed on the capitol grounds in Salem, Oregon. It was presented to the state of Oregon by a prominent business man of that state in memory of Oregon's early itinerant preachers, among whom was the donor's own father.

A counterfeit dollar bill, a rug reproducing a silver certificate, with finely woven portraits of Lincoln and Grant, was seized by Secret Service agents when it arrived in New York City from Greece where it was made. The rug is six feet by four and carries out the color scheme of United States currency. It is illegal to reproduce currency in any manner.

An abandoned boat lettered "Dauntless, Honolulu," was found on the coast of Zamboango without trace of the owner, Ira Sparks, of Peru, Indiana. Sparks' objective was the Holy Land, where he wished to "seek the true word of God." He shipped from the United States to Hawaii in a packing box.

The village of Allraht near Cologne, Germany, boasts the first church bells made of an alloy of aluminum and copper. They will not burst nor rust, and may be made at one-third the weight of bronze bells.

CHRONICLER OF THE NEGLECTED TRUTH

A Country That Has Lost Its Job

England, Tired and Bewildered, in Throes of Bloodless Revolution

By ALLAN L. BENSON

ENGLAND has lost her job, which, for a century, was to man and operate the world's workshop. The first to turn to steam and factory production, her goods went everywhere. The profits from her trade, gathered from the four quarters of the globe, rolled in upon London like a golden flood. Great families became greater. Smaller families were gold-plated. Stately marble mansions, now grown green and somber, mark the high-tide of the flood.

England became enormously wealthy because the rest of the world, industrially speaking, was but a babe in arms, unable to minister to its own wants. Her workingmen were not prosperous, but they were employed. They were not prosperous because, in economic understanding, they, too, were babes. They knew how to produce wealth, but they did not know how to obtain their rightful share of it. Their ignorance added to the flood of gold that gilded the best families.

But all babes that do not die grow up; the rest of the world, speaking broadly and generally, can now do its own manufacturing. It no longer needs to employ England. The rest of the world was bound to become self-sufficient, sooner or later, but the war and the German submarine blockade hastened its development by causing the dominions and other overseas customers to erect plants and do their own manufacturing. And these plants, once built, will never come down. Instead, they will grow greater.

Plant Is Overmanned

SO THE English workshops, which were made larger than ever to meet the needs of the war, are now chiefly devoted to the task of supplying the needs of England. That task is not great enough to keep busy what was once the world's workshop. The shop is larger than ever but the demand for its goods is smaller than ever. In other words, the plant is too big and overmanned. That is why unemployment in England is not only great but chronic. Englishmen still talk about bringing back the old times, but men and women always talk—for a while—of bringing back what can never be brought back. The Moors talked of returning to Granada!

England has lost her job. A nation without a job feels just as would an individual in the same circumstances. England is unhappy, somewhat bewildered, and so puzzled with her problems and burdens that it would be easy to make the mistake of assuming that she is discouraged. Under great pressure she is doing what all peoples do when the strains of life become too great to bear. She is changing the basis of her economic and political existence.

England is passing through a revolution. Her revolution is as real as Russia's—probably more real. It does not get so many headlines in the newspapers because it is not spectacular. Russia's revolution was a cyclone. England's is a glacier. But the means by which revolution is accomplished are never so important as the end. The means are always the expression of past pressure, present resistance and national temperament. The end is all that is important. If Washington had been able to secure the independence of the American colonies without fighting, the result would have been the same.

Not a Socialist Government

ENGLAND is having a revolution without fighting. The people of the British Isles have already dropped their pilot and put a new hand at the wheel.

It is plain, for instance, that the present government of England is not a Socialist government, in the sense that we understand Socialism in America. Americans, who read in their newspapers, day after day, that England is governed by Socialists, should understand this. Neither Ramsay MacDonald nor anybody else has a right to trifle with the definition of Socialism. In its fundamentals, it is a definite, precise thing, all statements to the contrary notwithstanding. It stands for the public ownership and democratic management of industry, to the end that the material things we need may be manufactured for use instead of for profit. Whoever disputes this does not know what Socialism is. Whoever rejects this doctrine, yet calls himself a Socialist, is either fooling himself or trying to fool others.

Since Mr. MacDonald became Premier, only a very few can see him to find out what he thinks about anything. A member of his cabinet told this writer that he—the cabinet minister—could not see him. The statement was so astonishing that it seemed incredible that it was meant to be taken literally. But a day or two later I was told by one of the pillars of the Labor party that nothing could be more literally true; that MacDonald has denied himself to everybody to such an extent that he has no time for even a certain member of his own cabinet, without whom the Labor party hardly could have existed.

Getting Tired of MacDonald

THE men who led the movement that put MacDonald into office are, so far as I could learn, becoming tired of him. One of them, who edits an influential weekly, told me that it was only with the greatest difficulty that he could continue to support the Labor government. One of the greatest writers in England told me that the Labor government, under MacDonald, was not a Labor government at all, but only the trades union section of the Liberal party.

The complaint everywhere among MacDonald's intellectual supporters is that he has done and is doing very little to carry out the program of his party. This feeling is beginning to seep down into the masses. Such dissatisfaction can be understood. In the first place, all politicians promise too much when they are candidates for office. One of the most important members of the Labor government promised, when he was a candidate for membership in the House of Commons, that, if elected, he would move to put rents back where they were before the war. Of course, he might as well have moved to make the moon shine every night, and he has done no such foolish thing; but his constituents are now criticizing him. MacDonald is beginning to feel the criticism of the masses.

A sympathetic outsider instinctively feels, anyway, that the Premier is undoubtedly proceeding slowly to avoid shocking the country too much. But a member of the Labor government told me that such is not the case. "I doubt," said he, "if MacDonald would do more than he is doing if he had full power. What he is doing is all that he believes needs to be done."

"What has he done?" I asked.

"Oh, he has taken the 'gap' out of the pension law," he replied, "or rather removed the hiatus between payment periods during which pensioners suffered, and a few things like that."

"What is the rest of his program?"

"He would socialize the coal and iron mines."

"What about the rest of industry—would he socialize that, too?"

"No, I think not. He would leave the rest of industry to voluntary co-operation."

And, as Mr. Dooley says, "There you are."

Terrific Criticism

THE criticism of Mr. MacDonald from the left wing of his party is terrific. The left wing is chiefly composed of Clyde shipworkers and a few intellectuals. England calls them "Bolsheviks." They want MacDonald to move. Of course, he is moving. He has a housing program under way. It hasn't passed Parliament yet, but he is doing his best to pass it. What it will do, nobody knows. One of MacDonald's chief supporters told me that not so many houses would be built under it as the Tories built. The Tories, too, built houses. That is one of the interesting things about England. Conditions there are so bad, and private enterprise, in some instances, has so lamentably failed, that all parties have been forced to recognize the necessity of socializing certain undertakings. But they don't call it "socializing." They call it "subsidizing." Words don't matter. The point is that when necessity presses about so hard, people move!

That makes more trouble for Mr. MacDonald. Critics within his own party say he is doing nothing that in principle differs from what the old parties have already done; that he has broken and apparently intends to break no new ground; that he is not a sincere radical nor even a democrat at all. My own feeling is that such criticism goes too far. One may safely assume that Mr. MacDonald is doing what he believes to be best.

But the London intellectuals do not stop. An Oxford man who has suffered for his humanitarian convictions told me that he knew to a certainty that MacDonald broke the "unauthorized" underground and tram strikes by threatening to place technical men from the navy in the power houses.

"You watch that man," he said. "He will do something like this some day and that will be the end of him. The Labor party will then know him for what he is and turn upon him."

Nor does criticism stop there nor does it end with the "Bolsheviks." Everybody in the Labor party, as far as I could discover, is disgusted because the ministers of the Labor government have fallen for the court stuff. MacDonald they can understand. But to see an old-timer like Sidney Webb don knee breeches and lash on a sword makes them angry. It was suggested that perhaps this was all a mere matter of strategy born of a desire not to slap anybody's feelings in the face. This suggestion was accepted only in part. I was told that there are members of the Labor government—particularly those who have risen from the ranks—who simply eat this stuff alive because they like it. And their wives—I was told—how they do fall! But not much harder, I was informed, than their husbands. One of the horny sons of toil who now sits in the cabinet is frequently seen motoring with the Prince of Wales. When the Prince wants to take a little air and wonders who, of all his friends, would be the most delightful motoring companion, he has somebody phone to this Labor minister and out they go.

"Our royal family is very subtle," one of them said to me.

At Buckingham Palace

YOU read of a garden party at Buckingham Palace, the king's town residence, or at Windsor, a few miles out of London. The king walks about conversing nonchalantly with a gentleman who, a few years ago, was perhaps driving a truck or clerking in a store. One of the chief members of the cabinet formerly conducted a little stationery store in Glasgow. And the queen? With whom is she talking as she threads her way over the lawn? Why to no one else than the wife of some Labor minister who, day before yesterday, as it seems, was boiling potatoes with their jackets on and frying fish for her future Labor minister.

What will come of the present Labor government, the best informed do not know. The only thing that seems certain is that it will stay until its opponents believe it is in bad shape to go to the country for another election.

The judgment of this writer is that whatever Mr. MacDonald may or may not do with regard to the domestic affairs of the British Isles, he represents an improvement upon all recent prime ministers in what seems likely to be his foreign policies. He is something of a pacifier—a distributor of oil upon troubled waters. He may well be worth while for this quality if for no other. And he cannot be as bad as men in his own party paint him. Nobody could be.

It is an odd fact, but one hears more praise of the Labor government outside of the Labor party than in it. The Conservatives, Unionists and Liberals do not praise the Labor party as a whole, but piecemeal. I do not know how many times opposition members in the House of Commons said to me, speaking of this or that Labor minister: "He is the only honest one in the whole lot." Different individuals, at different times, thus praised practically the whole Labor government. Some Conservatives think well of MacDonald because he moves so slowly, but practically all are strong for Phillip Snowden, the Labor Chancellor of the Exchequer. Snowden's budget made him solid in the financial district of London. Everybody in "the city," as the financial district is called, feared him when he took office, but nobody there fears him now. Maybe he is all right. Time will tell. But members of the Labor party wish he were not praised quite so much by their political enemies.

Must Till the Land

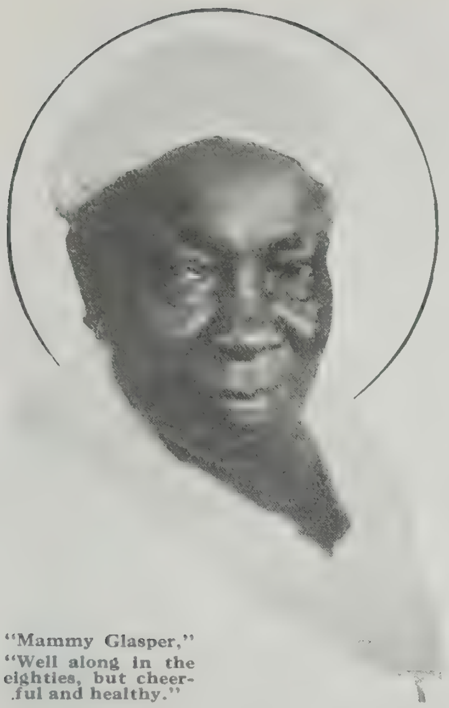
WHETHER England wants to or not, she will have to till her land. She has lost her job as the operator of the world's workshop. She has more people than can ever again find employment in industry. She has more than can be employed anywhere in England, for that matter. The British Isles are over-populated. Factory production, with its flood of wealth, increased the population in little more than a century from about 11,000,000 to 44,000,000. There are a million more women in England than men.

England is a sorely pressed country, out of work and passing through a revolution. As stated before, she will have to learn how to till her land and reduce her population before she can be happy, which is but another way of saying that England has a hard fifty years or more ahead of her.

Away Down South With Harris Dickson

A True Interpreter of the Negro

By HARRY E. BARNET



"Mammy Glasper," "Well along in the eighties, but cheerful and healthy."

Holt Collier, veteran bear hunter.

"If I ever got in trouble, and needed a man to stand beside me, I could count on Holt Collier."—*Harris Dickson*

A COLD snap had the South by an ear, and tweaked it. Also, it set Harris Dickson to pulling chunks of smoldering wood out of the capacious maw of the fireplace in the library of his Vicksburg home.

"Before we can sit here and talk with very much comfort," he said, "I'll have to rebuild the fire, because, whoever built the blamed thing this morning, did it flat on the hearth."

He added the while he worked: "Unless there's air under a wood fire, it never all day long will be a lively blaze, and when my servants forget this, why, I attend to the matter myself."

That was the start of a little journey behind the printed pages, so to speak, to get acquainted with Harris Dickson. But at the start of setting down the results of the journey, you're up a stump, if you want to hold the atmosphere surrounding the man. How to mention him in print is the question.

"Mister Dickson" is out of the running, because in his home state you find but two styles of reference to him. "The Judge," in Vicksburg, a title he earned. For not only is he one of the persistently characteristic southern writers and lecturers, but he also is a lawyer—though he doesn't practice law—and he served a hitch as city judge in Vicksburg. Elsewhere in Mississippi, "Harris" has the call, nine times out of ten. The tenth time it's "Harris Dickson."

He is, in other words, an honored prophet in his own country. A just judge, whose fairness while he was on the bench still is bright in Vicksburg. And apparently he is on first-name terms with every man and woman worth knowing throughout the state. As closely as a stranger can figure it, he is a combination Mississippi institution. Particularly, an intellectual leaning post—a reference library in human form. Winnowing the state for facts about this and that, "You better see Harris, too," is the prevailing advice. "He can tell you more of what you want to know than anyone else."

Not to be aware of the status of "Harris," if you're thus ranging the state, is taken by a good many Mississippians to be an unseemly gap in your education. Witnesseth: the red-pepperiness of the up-to-then charming woman in a small town. She was the first person to hand out the prevailing advice. And she peeved at the natural question: "Who is Mr. Harris?"

"Mister Harris!" she exclaimed.

The tone of *"Mister Harris!"* was heavy with desolation. To boot, it wizened, as one imagines an all-over souse in a tub filled with the juice of unripe persimmons would shrivel his flesh—

"Why, Harris Dickson, down in Vicksburg," came in the nick of time. "You're going there to talk with *him*, aren't you?"

Otherwise, no talk with "Harris!" This could mean but one thing to her—half-baked information, whatever the subject.

Before Vicksburg is reached, you begin to smell a mouse about this "Harris" business. Too many people, and too many varieties of them, speak of Harris Dickson as if he belongs to the family. Several somebodies, you think, are trying to pose as intimates, when, as a matter of fact, they're not even on bowing terms with "Harris." An assorted list was made of the names of people here and there who thus spoke in a cheek-by-jowl sort of way. These names were casually mentioned while Harris Dickson cleared the fireplace.

"Oh, yes, I know them very well," was the equally casual reply.

So, you're up against a choice: "the Judge," or "Harris," when it comes to mentioning him in print. But to end the perplexity, personal selection is "the Judge."

He fitted a backlog in the fireplace. On a pair of massive andirons, and over and around a crumpled newspaper, he built an unchinked-log-cabin-like structure of oak slats, and quarter sections of logs, each nearly long enough to serve as a mountain climber's staff, had they been thinner.

"There's one of the reasons why we're so poor down here in Mississippi," he stopped to say, and he held up a quarter section of log.

"That piece of wood is clear oak, and it's as sound as a dollar," he went on. "As a piece of firewood, it's worth probably two or three cents. But if somebody turned it into wheel spokes, or into any one of a dozen things it should be turned into, think of its value!

"Waste!" exclaimed the Judge. "Down here, we like wood fires, and we continuously turn one of our best resources into ashes."

The crumpled paper was fired with a safety match.

"Not many safety matches used in this section of the country, Judge," was the remark. "It's almost impossible to buy them in Jackson. The friction kind has the run there."

"I know," he replied. "But I won't have a friction match in the house. Imagine the loss I'd have if a fire started here!"

If the library alone were gutted by a blaze, leaving the remainder of his home untouched, the loss would run far up into dollars, yet dollars would be the least part of the loss.

Travel trophies are scattered about. Among them, weapons of fierce African tribes visited by the Judge. Original drawings, that illustrated the Judge's stories, fill one place and another. Volumes of photographs lie here and there—

"I take photographs, and preserve them, as much for use as memoranda in preparing my articles as I do for use as illustrations," he explained.

Plunder, also, of the very old South is much in evidence.

"There never was a country with more romance and mystery, and all sorts of queer adventures connected with it than this country you're in," the Judge said, "and I accumulate mysterious and romantic stuff all the time."

Books upon shelves that are built nearly to the ceiling hide the greater part of the walls of the library. Uncommon books—rare books, whose titles give promise of strange reading. But no idling books. All of them show use. A full half-dozen of them lay open at particular passages upon a long table in the center of the room. Three or four books were open upon a small table nearer the fireplace.

"I've been looking through a lot of these books this afternoon," he said, "hunting for all the possible meanings of a French word I want to use."

There is the reason why Harris Dickson is considered a sort of Mississippi reference library in human form. He earns the distinction. His library isn't a show place, nor the playroom of a literary dilettante. It's the workshop of a busy man, a student, and the atmosphere of calm, effective work is there. A great amount of material in it never could be replaced.

Above—HARRIS DICKSON. Below—Modern types of Harris Dickson Negroes in their conventional setting.

"If there is one thing on earth I know all about, it is building a wood fire," remarked the Judge, seating himself in a big chair, and stretching out comfortably—not lazily, but as a man lithe with reserve power in an attitude of quietness. We were in comfort.

But—one thing was missing. A dog! An open, cheerful fireplace without a dog lying on the hearth! The situation raised a remark.

"I have no dogs," said the Judge, "though I love them, and my children are crazy about them.

"At one time, I had two of the most royally bred collies that ever were, but those dogs would lie out here in the yard, and they would watch the cattle off yonder, and they wanted something to do. I just looked at them, and I kept looking at them—my animal friends—they were so very unhappy, like people in jail. So I packed them up, and gave them away to some people who have a lot of cattle, so the dogs would have something to do.

"I think the most pitiful thing is the city dog who has nothing to do," he continued. "I know in New York City a perfectly gorgeous Russian wolfhound—he is a thing of power, and I see a little girl with spectacles leading that dog in leash. It's just a pity.

"Don't you see it that way?" he queried, and turned squarely toward his listener. "Why, I could no more keep those collies that we all were crazy about than during school term I could keep my children in a room on Saturday when they want to play."

Talk was rangy, inasmuch as getting acquainted did not mean an interview. Conversation hopped about over the earth—Paris, New York, Natchez, London, Africa . . . .

"People say the world is small," the Judge remarked, "but we merely think it is, because people of the same type frequent the same places. When I go to Paris, I naturally go to places where I find people of my type. People I meet there know me, and I know them, because we are of the same type. These people are bound to know other people that I know—and we say the world is small. The same way in New York."

Writing, of course, came up as a subject, and as part of the talk, the varieties of dialect one sees used in southern stories.

"There is no dialect of Southerners," said the Judge. "It isn't dialect at all. It's a softening of the tones of the voice. Margaret Anglin laughed at me one time when we were talking about it. 'Don't you say that is dialect, Harris?' she said. Take myself, for instance. I have been out of the South a great deal, and I don't think I have what you call a dialect. Yet, what Margaret Anglin says may be perfectly true—I don't know.

"But it is curious about the Negro dialect," he went on. "The Negro uses a great many words that are the best English, but they have passed out of use."

Here the Judge got up, and unerringly placed his hands upon several books on a shelf in the far corner of the room.

"For instance," he said when he was again seated in his chair, and had the books opened upon a small table near his elbow, "the Negro says 'ax' for ask, and 'ax' was the usual form—a perfectly good English word. The Negro says, 'unpossible,' which is a perfectly good word, but obsolete and rare, the book says.

"Then there's 'tote,' to carry. That's a perfectly good word. I think you'll find it in the King James Bible. A good many of the words the Negro uses he probably got from his early association with the poorer white class, who were descendants of the English servant class brought over here. They brought with them the language of middle-class England of that time, and those words probably endured in the Negro dialect."

That brought up the subject of Negroes. Harris Dickson has written a world of copy about them—his series of "Old Reliable" stories, for instance; and the

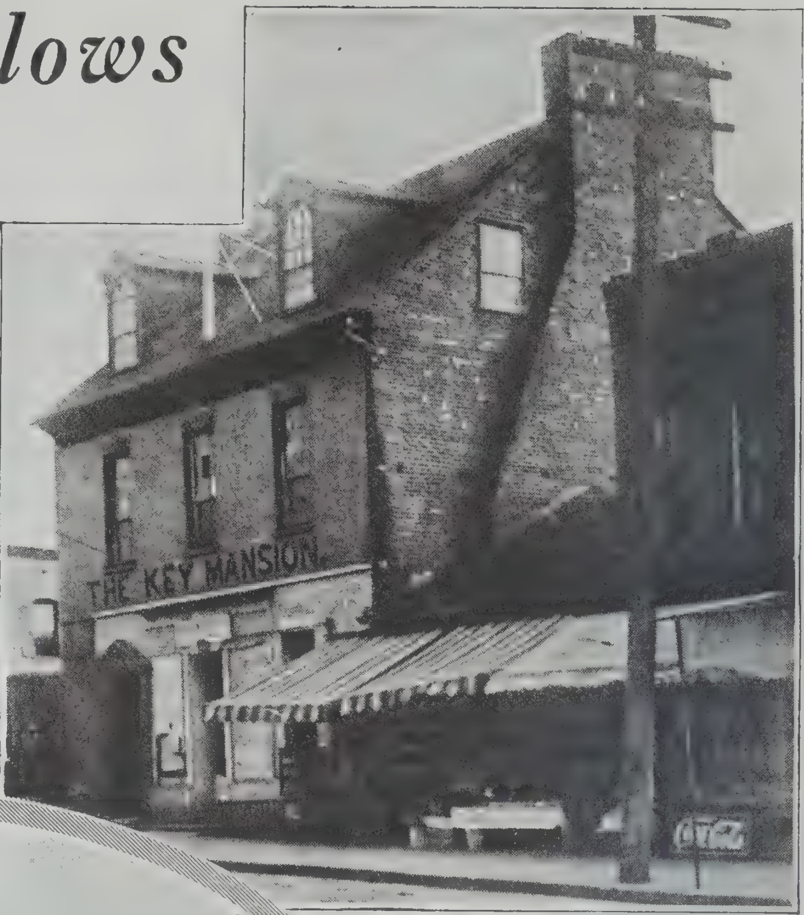
Where the Potomac Flows

Georgetown—Home of Heroes and the Cradle of Culture

By WILLIAM JOHNSON MADDOX



The old home of Francis Scott Key as it appeared shortly before it was torn down a few years ago. Here his eleven children were born, and from here he started out on his mission to Fort McHenry to seek the release of a friend held by the British. It was on this occasion he wrote the Star Spangled Banner. On this site now rests the north end of the Key Memorial Bridge erected by the government.

"'DEED, I'se a Southerner—I wuz born in Georgetown," says the comedian for the benefit of a Washington audience, and never fails to draw a laugh. Passing over the delicate shade of sectionalism involved, the time was when the mirth would have been on the other side of the mouth. Or rather on the other side of Rock Creek, the picturesque little watercourse that separates this drowsy, quaint old section from the rest of Washington. For the present-day butt of neighborly ridicule was a teeming, prosperous port of world commerce when the National Capital was in reality a "city of magnificent distances"—and not in the sense in which we use the epithet today. The Pennsylvania Avenue of inaugural splendor was a good long mile of deep morass covered with elder bushes. A path had to be cut through them to the Executive Mansion.

Living in the White House in those days was something of a patriotic test. A "wilderness city," Mrs. Adams, the first mistress of the unfinished structure, called the new home of the Federal Government—and for want of a better use to put it to dried the family wash in the East Room, now famous for its elegant state functions. We can imagine this democratic housewife looking forth ruefully upon the encompassing brakes and tangles.

No sooner had the government moved into its "city of streets without houses" than a chorus of dismal complaints went up. One wing of the Capitol had been completed, six rooms of the White House finished off, and several small buildings thrown up to house the different offices. The rest of the city was on paper. Its ardent promoter and namesake had died the year before at his beautiful home, Mount Vernon, a little farther down the Potomac. Plenty of sarcasm was spilled over the infant city. "A mudhole almost equal to the great Serbonian bog," one critic termed it. After their agreeable life in Philadelphia, where the government had been located for ten years after leaving New York, officials turned to "Washington's city on the Potomac" with disgust, and gave free vent to their feelings in caustic letters to the newspapers of the prominent cities.

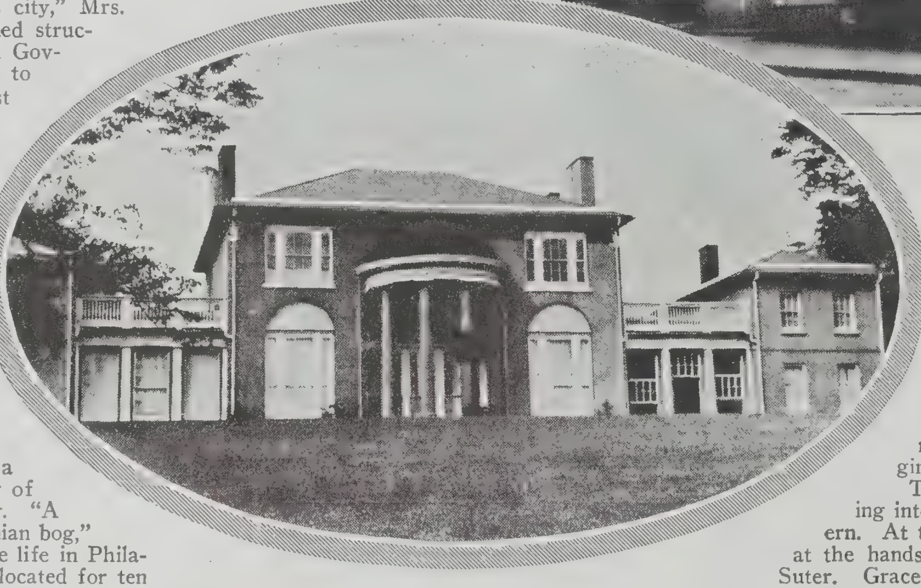
The distasteful pill, though, was of their own concocting, and it remained for Georgetown to give the sugar coating.

At the time the Federal Government moved to its new home—October, 1800—Georgetown was rounding out its first half-century. A gay and agreeable society had grown up there. Trade had prospered, wealth had accumulated, and there had come an ease and culture in its life that attracted men of fashion and distinction. The society-loving Jefferson, at the time he was chosen Secretary of State (1792), resided in a brick house in what is now Jefferson street—west side, south of the canal—a neighborhood which has long since deteriorated.

The new city thus found a society awaiting it, ready made. Just across Rock Creek was an ordered, polished life, with spacious homes and a traditional hospitality—all within the distance of a mile or two. It was not strange that official life from the President down fell in with it. The President, during at least part of the year, had to reside in the Executive Mansion. Not so the other members of the government. They were free to go and come as they pleased, and could flee the woods and marshes for the gentler environments.

In this way Georgetown took the National Capital under its wing and became the center of official and diplomatic society. It was well into the nineteenth century before Washington had a society of its own and the prestige of its mentor began to wane. For the first decade of the century members of Congress preferred to reside in Georgetown, making their daily trips to the Capitol through the mud of K street. Many foreign ministers kept their residence in Georgetown far into the thirties.

Among the famous stopping places for members of Congress was the old Union Hotel, known also as the Union Tavern, in M street. The original building was erected in 1796. It was destroyed by fire in 1832, and was rebuilt in 1836. Here Murray, the first British minister to the new Republic, made his residence. Talleyrand was another of its notable guests, as was also Louis Philippe, Count Volney, Baron von Humbolt, Jerome Bonaparte, Washington Irving, and John Randolph of Roanoke.



An old Georgetown home of the Custis family. It had passed out of their hands, though, by the time George Washington married the "wealthy widow Custis." However, he and Lafayette were frequent guests there.

Our English visitors of the early days each looked upon it as a sacred duty to record somewhere—in letters, diaries, even books—their impressions of American life. A casual inspection of these quickly reveals the rarity of bouquets, even of the most faded kind. It is refreshing then to come upon such a nosegay as that presented by Sir Augustus Foster, one of Minister Murray's attachés in 1805.

"There is no lack," wrote this amiable sojourner some years later, "of handsome ladies for the balls of Georgetown, drawn from the families of the members and others who come for the season. I never saw prettier, more lovely, or better-tempered girls anywhere—mostly from Virginia and Maryland. As there are but few of them, however, in proportion to the great number of men who frequent places of amusement, it is one of the most marrying places on the whole continent; a truth which was beginning to be found out and became by and by the cause of vast numbers flocking thither, all around from the four points of the compass."

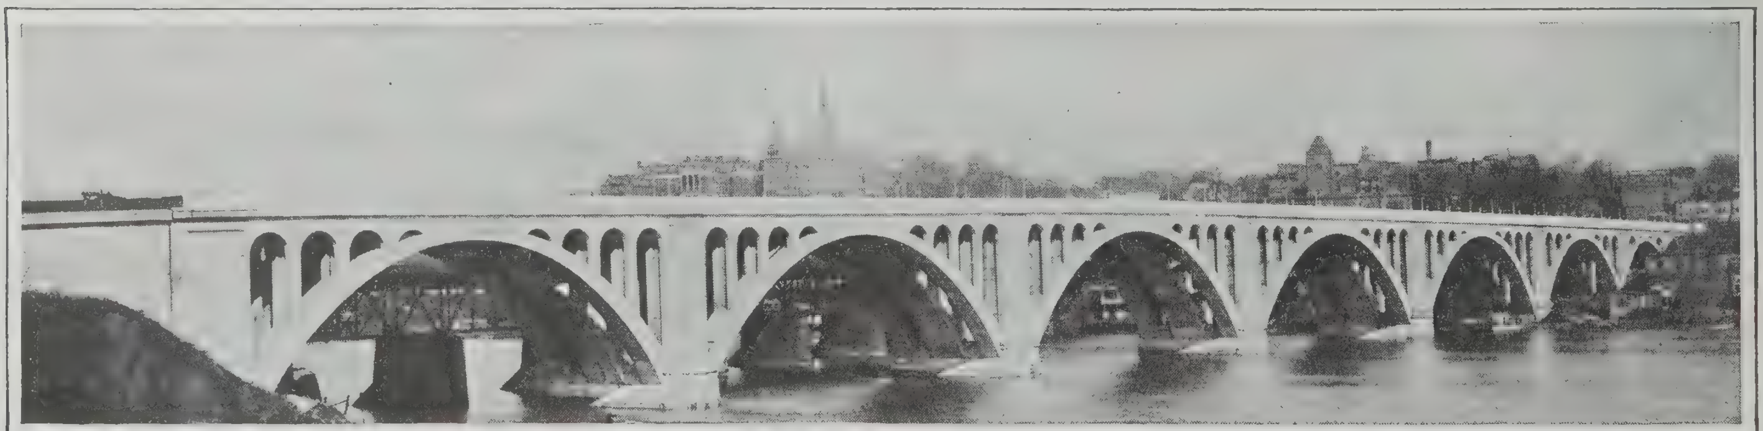
Nor were balls the only diversion of that society. The wealthy planters of the surrounding country kept alive the traditional love of their English forebears for hounds and blooded horses. Fox hunts and horse races were notable events; the latter were always, rain or shine, well and fashionably attended. Many a time Congress let some important measure go over so that it could get away early. The track was two miles away, and on an allowance of six dollars a day a good many members were obliged to walk it. If rain overtook them at the track, they made the best they could of what they could get in the way of food, thinking, no doubt, of the capital dinner going begging at the boarding house.

Toward nightfall they would begin drifting into the Union Tavern and into Suter's Tavern. At the latter they found cheery entertainment at the hands of that honest, genial Scotchman, John Suter. Grace Church (Episcopal) today stands very nearly on the exact spot occupied by this noted resort. Here a good meal was always to be had, and it was here that the commissioners appointed by Congress met and arranged for the founding of the National Capital. In those days, General Washington, on a spirited horse pegging it up to Suter's from Mount Vernon, was a familiar sight on the old Alexandria turnpike.

Not far from Suter's began Cherry Alley with its narrow, winding streets. Washington was called the "city of streets without houses"; Georgetown was the "city of houses without streets." This was the court end of town. Here beauty and wit reigned. In many ways Georgetown's decay of business has dealt kindly with the old landmarks. A generous number of its two-story houses built of brick brought over as ballast from England remain. Sloping slate roofs were popular in this section, and queer-shaped gables with dormer windows. Any summer's day rows of preserves and pickles might have been seen sunning on the sills—a temptation to the boys of the neighborhood. The young Francis Scott Key, so tradition says, was no exception to his sweet-toothed generation. Cherry Alley still survives but as a squalid picture of its former self.

A memorial bridge to Francis Scott Key now spans the Potomac at the foot of Thirty-fifth street. It was authorized by Congress in 1916 and was built at a cost of $2,300,000. With its coming, the famous old Key mansion passed out of existence. On its site now rests the north end of the magnificent structure that furnishes a highway between Georgetown and Arlington.

Like many other pre-Revolutionary towns in the United States, Georgetown is supposed to have taken its name from English royalty—George II, then Prince of Wales, and by far the best of the four. It was this plucky but ludicrous George who leaped from his un-



The Key Memorial Bridge from the Virginia side of the Potomac. It cost $2,300,000. The far end rests on the site of the old Key Mansion, the home of Francis Scott Key. In the background is Georgetown. Through the arches may be seen the old Aqueduct Bridge, formerly used to carry the C. & O. Canal across the river.

A quaint corner of old Georgetown. The fence is a local curiosity and is known as the "gun-barrel fence." At the close of the Mexican War the government found itself in debt to the owner of the house, a Mr. Darr, who took a lot of old guns as part payment. He used some of them to build himself a fence.

manageable steed at the battle of Dettingen and swore that now that he was on his own feet there would be no running away.

As a monument of its former greatness when it vied with Philadelphia as a site for the National Capital—and won—still stands the old customhouse. Before the advent of steam transportation, Georgetown was considered especially well situated. Its position at the head of a river that was navigable a great distance inland was very advantageous. Its problem was to connect with the rivers of what was then the western country.

The men of Georgetown were enterprising. They saw the possibilities of a canal across the watershed. George Washington took an active interest in the project. It was not until the middle of the nineteenth century that the Chesapeake and Ohio canal was actually built. But he lived to see its forerunner, a sort of makeshift, built at a cost of $750,000, all subscribed by the business men of Georgetown. By means of this, trade was extended as far as Fort Osage on the Missouri, to Lake Erie, and to Mobile.

During the time it was in use, 1,211,903 barrels of flour and 42,456 barrels of whisky were brought to tidewater, realizing $238,117.66 in tolls. The value of the merchandise was about $9,935,964. Fifteen thousand boats of 179,554 tons were engaged in the trade.

In 1789, Congress made Georgetown the sole port of entry for that territory and appointed a collector to reside there. From 1801 to 1821, duties aggregating $520,000 were collected upon foreign merchandise; and from 1790 to 1801, about $100,000.

Records of the customhouse give the names of an imposing array of vessels owned in the town during the early days of the last century. Three and four hundred tons burden was not exceptional. There is one entry of the *Calcdonia,* built in 1828, that carried 647 and a fraction tons.

It was not until 1895 that Georgetown, by an act of Congress, lost its civic identity and became a part of Washington. At that late day even, a hoopskirt or two still made its appearance on the streets. Their wearers were familiar characters, eccentric old ladies who clung fondly to the habits of a fading past. Children stopped their play to giggle and pass comments, not always well guarded, on these objects of curiosity.

In old Oak Hill Cemetery, with its quiet, green slope to Rock Creek, is the grave of John Howard Payne, the author of "Home, Sweet Home." Not far away is the grave of Mrs. E. D. E. N. Southworth, the novelist, whose old home, Prospect Cottage, still stands, weather-beaten and decayed. Here, too, is buried E. M. Stanton, Lincoln's Secretary of War, who very nearly shared assassination with his chief. In a newer part of the cemetery is the grave of John A. Joyce, poet, soldier, and philosopher.

As already stated, there is a generally accepted tradition that Georgetown was named for George II of England, but according to good authority it was another George, also an Englishman, who gave his name to the new settlement, this being no other than George Boone, grandfather of Daniel Boone, the famous pioneer.

George Boone and Mary, his wife, emigrated to America with their family of eleven children, and arrived in Philadelphia on October 10, 1717. They were natives of Bradwich, near the city of Exeter, in Devonshire, England, and soon after he landed in America, George Boone purchased a large tract of land in what is now Berks County, Pennsylvania, which he settled and named Exeter.

Boone subsequently purchased other tracts of land situated in Maryland and Virginia; among them the ground upon which Georgetown now stands, which he laid out and named after himself. He was a member of the Society of Friends. Thus, if this version of the founding of Georgetown is accepted, we find a co-religionist of William Penn displaying something of the same spirit of pioneering enterprise.

George Boone had a son, Squire Boone, who married Sarah Morgan and became the father of Daniel Boone. About 1748, when Daniel was in his fourteenth year, his father removed to North Carolina, where he settled at Holman's Ford on the Yadkin, and engaged in farming in which he was assisted by his son.

The tract of land on which Georgetown was founded formerly belonged to Colonel Ninian Beall, a native of Scotland, who called the site of the future town the "Rock of Dumbarton." He was one of the early settlers of Maryland and became a noted man in the early history of that state.

Oddly enough, the social pendulum is swinging back to Georgetown. The last few years have seen a number of changes in this quiet old town. In New York, society folk have begun moving back to old Avenue A, under the lead of Mrs. Vanderbilt. In Washington, they are buying and remodeling the handsome old residences of Georgetown and a new social life is being created there.

The towers of Georgetown University overlook the river and are familiar features of the sky line. The school was founded by John Carroll, bishop of Maryland, in 1789, and became a university in 1815. It is one of the largest Catholic educational institutions in the United States.

Yes, We Have No Cafeterias in Germany

By WALTER M. WOLFF

THE average German seldom patronizes a café or restaurant unless he is his own timekeeper and does not mind consuming at least an hour for breakfast, at least two hours for dinner and not less than two hours for supper. If he must hurry he usually belongs to the lunch-basket brigade and munches his sandwiches at the office à la go-right-on-with-your-work. What every German would sincerely welcome, and what he really needs, is a genuine American cafeteria, conducted in true American style, with American prices, American quality, and, above all, American service.

Berlin, which is the pulse of the German Reich and third largest city in the world, boasts of magnificent buildings, palaces, and shady boulevards but it cannot muster up a single eating establishment which in any way resembles a small-town American cafeteria. One American restaurant where it was possible to secure American dishes, such as pork and beans, fritters, or fried chicken, did business for a time but it no longer exists today. Had the proprietors of the establishment opened up as a live American cafeteria in a prominent location, we might have something quite the contrary to report.

We find, however, in Berlin, a chain of some thirty little beer shops controlled by a large concern which also owns the Leipziger Hof and Rheingold restaurants near the Potsdamer Platz. These shops go through some of the motions of a cafeteria but specialize chiefly in light and dark beers (also bock and porter when in season) for the benefit of thirsty pedestrians who pass by and see the glistening, prominently conspicuous beer fountain in the window. Aside from alcoholic beverages, potato salad and wieners with free mustard are served (mainly to whet the desire for more beer).

If one prefers there is cold ham or sardines in the offing and a bun or two may be ordered to touch off the meal. In the center of every beer hall are small round tables about which the visitor may *stand,* drink his Patzenhofer, eat his sausages, and proceed on his way a sadder Budweiser man. The fact that he must stand obviously does away with the need for chairs of which each hall has but a few or none for the benefit of the few or no ladies present.

For the man or woman who desires something in the way of a quick, warm meal, say, at lunch time, Berlin has what it thinks are cafeterias in some of the large department stores in the downtown shopping district. We shall take, for example, the "cafeteria" in the big Wertheim department store on the Leipziger strasse. Here meals are served near-cafeteria style or on the help-yourself plan without the help-yourself.

Upon entering a large hall called the "Tee Raum" or Tea Room, one sees upon looking around either many other rooms and tables or few tables and a great many guests. Off to one side and all out of proportion to the size of the place is the food counter with but very little food in sight. Instead, a multitude of small-price placards crane their necks and crowd one another off the glass showcase as if fighting for recognition or supremacy. The main bill of fare looms up somewhere in the rear, much as a mother hen among her chicks and chickens, and may be studied quite at leisure for "no one bothers to wait on you."

The guest (and uninitiated newcomer), after scanning the various signs and selecting what he thinks to order, now steps up to the counter and says, "Soup, roast beef, vegetables, apple s—". . . . "Just a minute, sir, haven't you a slip? Right over there, sir, please give your order to the cashier."—And he, you or any one else steps over to the cashier and begins again: "Soup, roast beef, vegetables, apple sauce". . . . She writes them down in order as quickly as she can and then greets you with, "And your table number is—?"

Of course, you hadn't thought about a table yet and less about a table number, so you sputter out, "I—I don't . . . . I—I'll have to go and see. Wait a minute!" Looking hastily about, you fail to find a single table unoccupied but away back at the far end of one of the large rooms is a table where you can sit all alone and eat in peace and comfort. Oh, yes, the number. You hurry back to the cashier only to find to your utter chagrin that a large crowd has gathered about her booth and that you must wait your turn.

Finally, however, you may inform the cashier where you are sitting, pay your bill, and learn that you can go back to your table and sit down; your order will be brought to you by the waitress. "Don't forget your knife, fork and spoons!" calls a young lady next to the cashier as you are about to go. Of course, you want and need these utensils and learn that you may have the same upon payment of a deposit of one mark for each piece. So together with a free paper napkin you finally arrive at your table very much relieved at the prospect of sitting down at last.

All around you are people who are eating, who have eaten, or who have yet to eat like yourself. At not too frequent intervals comes a waitress with her tray of food but somehow she always manages to avoid your table in passing. She invariably deposits her order at some table with a different number than your own. It suddenly dawns upon you . . . . could you have made a mistake? No wonder your order doesn't arrive; but no! you are sure you said "83" and not "38" and that was right. What a relief! You won't have to go back to reorder again.

Hungry and more or less out of sorts by this time, you fail to connect anything funny with the fact that after nearly fifteen minutes of patient waiting your food hasn't arrived yet. You recall that someone once said something about "Patience on trial" and it occurs to you that "Everything comes to him who waits," and similar stimulating bromides cross your brain but it is all of no avail. People around you get up and leave and others take their places. Here and there someone chafes like yourself and pounds the table, angrily demanding his food immediately or he'll . . . . and so forth.

By this time fifteen minutes have fully elapsed and even you are about to explode when behold, the waitress stops at *your* table with the much-longed-for victuals. She mumbles something about being *so* busy and departs leaving you to enjoy the lunch—if you can! Has she forgotten anything? Yes, confound it, the apple sauce! but never mind; you don't intend to spend the entire afternoon in the Wertheim Tea Room without at least a struggle. It strikes you that perhaps, after all, they want you to stay for supper (which is not served here as the "cafeteria" closes at 3 p. m).

Your meal is finished! Slipping on hat and coat you make your way around to the entrance feeling as if you had forgotten something. As a matter of fact you really have, ah, the knife, fork and spoons. Of course, you want that deposit back and return in haste only to find that the waitress is just in the act of clearing your table and has already removed the desired articles. Yes, she gives them back to you upon explanation but they had been tucked away somewhere among the greasy dishes and are naturally unfit to be handled until after the usual immersion in a hot water and soda solution. But you don't mind this a bit and finally arrive in time to reclaim your deposit and to wash your fingers at the first opportunity. "What a life!" you gasp as you emerge from the store and wonder whether you still have time to take in a restaurant before bedtime.

The Worst Bureaucratic Tendency of All

Inception and Growth of the United States Children's Bureau; Notions of Some Leaders in the Movement Revolving Around It

By ROBERT KENTON

When the establishment of the United States Children's Bureau was proposed as a fact-finding agency a majority of the people looked upon the move with the friendliness that flows from humane interest in the welfare of children. Some thoughtful persons opposed it on the ground that it would not long continue to be only a fact-finding agency but would be made the basis for dangerous encroachments by busybodies, bureaucrats and revolutionary theorists on the rights of the states, local communities, parents and even the children of the country. That was more than a dozen years ago, What is the subsequent history of the undertaking and of the movement revolving largely around this Federal Government establishment of such innocent and beneficent appearance? It, together with the story of the bureau's inception and the promises made by its Congressional sponsors, is set forth in this article.

ABOUT the middle of the first decade of the century someone, whose name the record doesn't disclose, invented a powerful phrase, to wit:

"Pigs versus Children."

Some say the phrase came out of the National Socialist Party Convention of 1908. It first came prominently before the public in 1909, in connection with a proposal that Congress establish a Federal bureau to collect and distribute information having to do with the children of the country.

Miss Lillian D. Wald, superintendent of the Henry Street Settlement, New York, appears to have originated the bureau proposal. The idea was taken up by Miss Florence Kelley, a resident of the settlement and then as now secretary of the National Consumers' League, and was elaborated into a workable plan.

The proposal made no progress in Congress until three years later, when Senator William E. Borah took it in hand in the Senate and brought about its adoption by that body. The House of Representatives concurred, and in 1913 the bureau became a fact.

Chief argument for the establishment of the bureau was based on the "Pigs versus Children" slogan.

"The government is spending large sums of money on the development of better pigs and other animals but not a cent for better babies," the bureau's proponents argued with much effect. "Aren't children as important as pigs?"

Despite this ingenious argument and that carried by the name of the establishment to be set up, the proposal met with opposition in Congress, not from large numbers but from some of the ablest members of the body at that time.

Organization and Personnel

OPPOSITION was based on several grounds. One of these was that the undertaking was beyond the constitutional powers of the Federal Government.

This was met by the claim that the establishment would be given no sumptuary or regulatory power but would be authorized only to gather and distribute information that would be helpful to other agencies, state, local and private, in shaping and carrying out child-welfare programs.

The Senate Committee which recommended the passage of the bill said in its report:

"The bill is not designed to encroach on the rights nor relieve the states from the duty of dealing with the subject but to furnish information to enable them more successfully to deal with it. It was the opinion of the committee that the duty devolved primarily upon the states to legislate upon this most important subject and the states can more effectively deal with it. But it seemed to the committee that there was a duty upon the part of the national government to aid in getting such information and data with a view of assisting in the work, and that the national government could get such information and data more effectively than the respective states."

The bill, as passed, limited the bureau to making investigations and reporting "upon all matters pertaining to the welfare of children and child life among all classes of our people, and shall especially investigate the questions of infant mortality, the birth rate, orphanages, juvenile courts, desertion, dangerous occupations, accidents, diseases of children, employment and legislation affecting children in the several states and territories."

There was further objection to the venture on the ground that it would be but an entering wedge toward more far-reaching undertakings.

"Men who are familiar with the course of legislation," declared Senator Joseph W. Bailey, of Texas, "know that these matters come first in the shape of requests for statistics and they invariably are followed by legislation. Another six years will find some Senator asking this body to enact legislation intended to cover some phase of child life in the country."

In fact, demand began almost immediately for addiional legislation in the premises; and in less than five years the Children's Bureau was given power to exercise very positive authority over a phase of the country's child life.

Immediately after Congress passed the act establishing the Children's Bureau the *Woman's Journal*, now the *Woman's Citizen*, official feminist organ, said:

"Congress which appropriates $3.000.000 to promote the health of pigs and other animals has at last appropriated the meager sum of $30,000 for a Children's Bureau."

A month later, the same publication said:

"We shall not be willing to let the establishment of the Children's Bureau mean simply investigation—it must mean power to change things."

This publication represented better than any other the groups which sponsored the establishment of the bureau. Many women's organizations endorsed the proposal but it was put over chiefly by women leaders of the type which has become prominent and powerful in national affairs.

The outstanding one was Mrs. Kelley, in her youth the translator of the writings of Karl Marx and Frederich Engel, founders of modern socialistic and communistic movements. Miss Jane Addams of Hull House, Chicago, also was a prominent advocate of the venture, and from her establishment have come both women who have served as chiefs of the bureau to date. Another promoter was Dr. Anna Louise Strong, for some time connected with the bureau and lately the eulogist of Lenin and Trotsky, whom she knew in Russia, where she has been for the last several years. Dr. Owen Lovejoy, secretary of the National Child Labor Committee and rated in some quarters as a Socialist, and Judge Ben Lindsey, of Denver Juvenile Court fame, also were active advocates of the bureau's establishment.

Miss Julia Lathrop, its first chief, organized the bureau, with a working force of fifteen persons. The bureau's work, from the start, has partaken, in general, of two kinds—investigation and propaganda, though the law in the beginning and at present makes no provision for the latter.

The first investigation has to do with the registration of births, then required by law in only a few states and still not required in some. Propaganda for more and better birth registration laws and facilities followed.

Then came investigations of infant mortality in various communities and of other subjects mentioned in the law. These investigations as a rule have been well conducted and have developed a great deal of valuable information.

Along with them, however, there has been carried on two lines of propaganda. The first of these has to do directly with child care, partaking of the nature of exhibits and pamphlets relating to such things as the feeding, clothing and general care of children and mothers. The second has had to do with legislation.

On its formation the bureau became a center of propaganda for Federal laws relating to child labor. In 1916 Congress passed what is known as the first child-labor act and its enforcement was intrusted to the Children's Bureau. This act, passed under the interstate commerce clause of the Constitution, was annulled by the Supreme Court. The enforcement of the second child-labor act, passed under the taxing power, was put in the hands of the Treasury Department. It also was annulled. Since then the Children's Bureau has been a leading advocate of a constitutional amendment empowering Congress to prohibit or regulate the labor of all persons under eighteen years old—a proposal that is at least quite far-reaching.

Rapid Expansion

IN 1917 the Children's Bureau put forward the first proposal that the Federal Government take more than investigatory action with regard to maternity and infancy.

Its investigations of infant mortality had disclosed what seemed to be a high rate of death from childbirth as well as a high infant mortality rate for the country as a whole. Experiments in New Zealand and Australia and Great Britain led the officials of the bureau to the conclusion that the most effective way to attack both these problems was through what it termed Federal aid.

"Especial precedent exists," said Miss Lathrop in her 1917 report, "in the United States for creating a method of affording public protection for maternity and infancy with Federal aid." The precedent referred to was that of the appropriations made to the states for such things as agricultural extension and road building, these being on a "fifty-fifty" plan whereby the benefiting states match Federal funds, the Federal Government retaining the power to pass on plans and otherwise supervise expenditures.

Persons in those circles wherein the idea of a Federal Children's Bureau originated and was promoted immediately took up this proposal, and urged it chiefly with the "Pigs versus Children" slogan.

Some members of Congress who supported the establishment of the bureau revolted against this suggestion of expansion. Even Senator Borah voted against the so-called maternity bill when it came up for passage and was passed. Senator James A. Reed, of Missouri, who was a strong advocate of the Children's Bureau in 1912, was probably the sternest opponent of the maternity bill.

Senator Reed declared that the measure's title should have been "A bill to authorize a board of spinsters to control maternity and teach the mothers of the United States how to raise babies."

He charged that every woman, with one exception, in executive position in the bureau which was to administer this big project was unmarried and that the chief promoters of the scheme were in the main childless.

The original bill proposed annual expenditure out of the Federal Treasury of more than $4,000,000 on the project. As finally passed, $1,250,000 was allowed. Five per cent of the funds or about $50,000 is for the expenses of administration by the bureau in Washington. The remainder is divided among those states which put up equal sums and submit plans of operations to the Children's Bureau for approval.

While this bill was pending it was charged that "During the delay by Congress approximately 625,000 babies have died from causes (chiefly preventable) prenatal or connected with childbirth and infancy," the inference being that these would have been saved had the bill been promptly enacted into law.

The law has been in effect now for more than two years, a period much longer than the one of "delay" but in no report on its operations is the claim made that anything like that number of infants have been saved. In fact, no report that could be discovered by the writer made claim of the lives of any mothers or infants having been saved by reason of this new Federal Government activity. Several states, resenting the encroachment of bureaucratic meddling thus envisaged, have refused the funds thus proffered and will have nothing to do with that part of the Children's Bureau work.

Thus in a dozen years a tiny bureau set up as a clearing house for information has grown, step by step, not only in the matter of funds but in that of authority.

In the bureau's second annual report, the first to cover a full year's operations, request was made that its appropriation be increased from slightly more than $25,000 to $104,000, to make possible an increase of its staff from fifteen to seventy-six persons.

In 1916, the bureau asked for $187.520 increase in its appropriation, to make possible a doubling of its staff. Congress granted it for the succeeding year an increase of $109.120, or a total of $273,760, with $150,000 additional for the enforcement of the first child-labor law.

"The Power to Change Things"

AFTER the child-labor law was annulled, the appropriation for that work was no longer made, but the bureau now has for direct expenditure more than $300,000, with power to distribute and supervise the spending of more than $1,000,000 more through agencies operated jointly with the states.

From the purely investigatory its authority steadily was elaborated into the regulatory and supervisory.

In 1919 in addition to urging "Federal Aid" for maternal and infant welfare, Miss Lathrop, then chief of the bureau, recommended the following venture:

"Federal aid to the states for universal elementary education for the prompt and immediate abolition of illiteracy and of child labor."

This last proposal is now embodied in what is known as the National Education Bill, which its opponents declare would mean, if passed, the ultimate federalization of the public schools.

Miss Lathrop, and her present successor, Miss Grace Abbott, were not conspicuous among those who promoted the establishment of the Children's Bureau. Each has made a profession of social service work under the tutelage of Miss Jane Addams; both are former residents of Miss Addams' famous Hull House. They were appointed, presumably, on the recommendation of others who were more active in the movement.

The movement, being accelerated by woman suffrage, has become much bigger and more inclusive than when it sponsored the setting up of a small bureau in Washington to collect admittedly needful information. It is now promoted by an active lobby, sometimes called "the most powerful lobby in the country," which is sustained chiefly by the League of Women Voters. This lobby has supported all the proposals for elaborating the Children's Bureau into something that "would mean the power to change things." These proposals invariably partake of extensions of the power and activities of the Federal Government, even as to most intimate and delicate matters of society and the home, some of them verging, or definitely leading, toward ventures clearly socialistic, if not communistic.

"Child welfare is a national, even an international problem, of the first magnitude and the economic aspects of the problem are the most urgent," the former chief of the Children's Bureau declared in one of her reports.

"The final purpose of the bureau," it is stated in another report, "is to serve all the children of the country, to try to work out standards of care and protection which will give every child its fair chance in life."

Yet the law authorizing this work had said nothing about working out standards or promoting their adoption, beyond supplying authentic facts.

"None of the studies made by the bureau," it is stated in another report, "attempt to approach infant mortality as a medical question. They are concerned with the economic, social, civic and family conditions surrounding young babies."

Yet, obviously, infant mortality is first of all a medical question.

In its comments on infant mortality, the subject to which it has given greatest investigatory attention, there is frequent reference to the "influence of economic pressure" and numerous statements like the following: "This study shows clearly the marked influence which ade-

Mr. Ford's Page

THE chief satisfaction one can take in the coming political campaign, as it outlines itself in the earliest utterances of the three main contestants, is that through one set of utterances there is promise of a way out of the conditions which all have deplored.

Of course, all will not be agreed as to which set of utterances fills this description. The vote of the American people at large—all save officeholders, prospective officeholders and professional or self-seeking politicians in general—will be given, for whatever party or candidate, because the voter believes that therein lies the country's hope.

There is that much to say about the American vote. Insofar as it is intelligent, it is cast for the country's good, by people who really believe in their hearts, or at least have hope, that such and such a political promise may be, like the divine promises, capable of successful fulfillment and incapable of being broken.

So that at present we have three main lines of promise or attack lined up for the people's favor. An equal sincerity may be granted each of them. Whatever may be the designs for "vote-getting," there is no reason to assume that one candidate is a hero and all the rest rascals. Fortunately the time long since came in this country when even the most rascally set of politicians dared not set up a rascal for their standard-bearer. Neither is the country any longer saved or lost by one man being elected and another defeated. The country is too big for that, too strongly set upon its destined way. But it is true nonetheless that the country *is advanced* or *retarded* according as one or another set of ideas is given governance.

There has practically been the same general and developing ideas governing this nation since its beginning. These ideas are not partisan but American. When one party forgot them, the opposing party, in the challenge of an election, carried them forward. That party is most successful that most closely follows the American idea. Elections that become contests for offices, and not great inventories of how men and parties have kept the faith, are not worth holding. The hope of ever introducing into this nation ideas foreign to its genius and destiny, is futile. On such an effort no party can ever hope to win an election. The best platform is always a clearer definition of why we are here as a nation and what part we can play in keeping civilization on an upward course among our own people and throughout the world.

THE present political campaign offers three distinct attitudes for the people's thought. One is an attack on industry and every form of success, on the theory that Big Business means the Money Power. Of course it does not. Another attitude attacks a dead administration, but not the present one, and raises the slogan of "Honesty in Government," as if all the rascals were in one party and all the saints in the other. Of course they are not. The third attitude is that of continuing straight along the common-sense road of American progress, extending the usefulness and prosperity of the American shop, enlarging the advantages of the American home, holding fast the established ideals of American liberties. This third attitude will win. Though it happens to bear a partisan name Republican, Calvin Coolidge is really the leader of the true third party, which is the American party.

Among the two older parties we have, first, the familiar attack upon the party which happens to be in office. It is a custom in American politics to attack the group that is "in." The substance of the present attack, however, is not delivered against the administration which is now in, but against one which was in, and which now is defunct. Even Mr. Davis knows that certain men, whose acts are now under question, did not comprise any part of a party, did not represent any section of the people, did not stand for any political principle whatsoever, were by the accident of political manipulation appointed to office.

Yet knowing this it seems politically necessary to charge the majority of politically minded people of the United States with wilfully supporting dishonesty in government, and to make this charge indirectly by the sounding slogan "Honesty in Government." Is there any party in the United States that does not believe in "honesty in government" and strive for it? Yes, there may be. Some obscure parties, moved by alien and anti-American spirit, seeking support among those who have not yet felt the emancipating influences of the English language, may be ready to loot and discredit and disrupt our institutions (as they did in Russia) if opportunity offers. Granting that, is there any party that has ever gained power, or that has any prospect of gaining power, that has not believed in and acted upon the principle of honesty in government? Not one. So, the issue is not there.

A set of utterances based upon the assumption that all the dishonesty is to be found in the party in power, and all the honesty is to be found in the party seeking power, is far too shallow to convince the American public. Individuals may fail in respect of duty; great aggregates of individuals seldom do. Furthermore, to base a campaign upon a dead administration, whether it be that of Grant or Harding, is singularly to miss the demand of the people that a constructive program be offered for their consideration.

That, then, represents one attitude toward the popular intelligence in this campaign; the attitude of attacking the Harding appointments—not the Coolidge administration. This, by the way, is the old-fashioned standardized and outworn mode of campaign.

Then there is the second set of utterances, that which pretends to champion the people as against Big Business. This also is an old standby among campaign practices. Big Business happens to signify the means by which the people of the United States make their living. All business in the United States, into however many pieces it may be broken, is inevitably big. This is a big country, with a big population, having big needs, and calling for big production and big supply. Even the toothpick industry in this country is a big one; you cannot name the most trivial commodity that is not in this country an enormously big industry. Even more bicycles are being made than at the height of the bicycle craze. How any political campaign against business can hope to succeed is beyond the understanding of an ordinary mind. It is the old confusion that Big Business means the Money Power—an illusion which has been dispelled on this page before. Such a set of utterances is not constructive; it is not even intelligent, except as it is contrived to catch the votes of people who do not reason.

A third set of utterances gives distinct attention to the proposition that America should continue straight along her course. Not novelty nor innovation but commonsense progress is the keynote of this attitude. It is not a conservative utterance in the sense of desiring to hold by political means the old unfair and undemocratic privileges of the so-called "conservative" class; nor is it a "liberal" utterance in the sense that it promises economic impossibilities, such as those attempted in Russia. But it is conservative in that it looks to the conservation of all the good which the nation holds, with a further vision of extending and enlarging that good in all safe and possible directions. It is indeed the voice of the new conservatism which proposes to bring to the public service the brains, the vision, the loyalty which not so very long ago were commanded solely in the interests of private gain.

Is this also only a promise, or has it given proof of its ability to perform the thing? We have seen what the new conservatism can do to stabilize the agricultural situation in the country. And even when politicians were talking about "America's timid foreign policy," we have seen Americans guiding several European countries out of their financial chaos. After all the test of everything is the ability to do and the quality of the deed. The new conservatism is not a movement of speeches nor a market for slogans; it is instinct with the ability to do big things and let the deeds certify to the world whether they were done for the benefit of all the peoples.

You have here, then, a party that is against the party in power. You have also a party that is against the party in power and against everything that savors of successful industry and employment. You have also a man—not to mention party—who is leading out of all the parties the progressive conservatives who want to see progress safely made. The true "third party" is that which Calvin Coolidge is leading—the party of the new conservatism.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Circumaviated

MAGELLANS of the air have been truly named, the Americans who were first to circumaviate the globe. We had previously crossed the continent between morning and night. Notable flights of various degrees of importance in the news, but all contributing their degree of knowledge to the art and science of aviation, have been made. And now the supreme feat has been accomplished—the earth has been girdled. Across uninhabited northern spaces and through seething tropics our men have flown. The people of many nations and of practically all the races have been their hosts. Orient and Occident have met them face to face. Their reception in Japan was as cordial as their reception in England. For they were not nationals so much as they were a new kind of *natural—the flying man who has accomplished more than any bird has dared.*

Men of other nations have made earnest endeavors and have achieved notably, but without the unfailing—shall we modestly say—"luck" which attended our men. MacLaren of Britain wrought nobly, but his endurance outwore that of his planes. So that, if the flyers themselves were to talk of nationalism in this matter, they would say that of course they are extremely happy that the first honors should come to the United States, but that after all the air is international, and all flying men rejoice in all other flying men's achievements.

As was explained in THE DEARBORN INDEPENDENT several weeks ago, this feat of putting an airline around the top of the globe was not a daredevil stunt, but an exploring expedition. Our flyers were charting the air, so to speak, gathering data for future use. As the United States Army charted the plains and made the maps and measured the rivers of the West, so the Army is now mapping the air. While it is a great spectacle and an ineffaceable historical record, the feat just accomplished was also a piece of scientific research.

To Hang at Nineteen

COMPLICATIONS have already arisen in the Loeb-Leopold case, as far as it affects public opinion. A boy from "back of the yards," poor and friendless and not a "super-intellect," who has not even pleaded guilty as Loeb and Leopold did but who strenuously asserts his innocence and who has been exculpated by the criminal who first implicated his name—this boy is sentenced to hang in October.

Every argument made in behalf of mercy for the Leopold-Loeb duet applies with manifold force to Bernard Grant. The sons of the two richest Jews in Chicago confessed they were guilty; this son of a Christian mother "back of the yards," who has supported his family since he was fourteen, has always protested his innocence. Yet the rich men's sons go to prison and to eventual parole, while the poor woman's son goes "into the night," to quote Clarence Darrow.

Leopold and Loeb will be paroled as surely as the sun shines. Any governor of Illinois can pardon them. In the not distant future a man will be made governor of Illinois on the specific promise to pardon them. By that time the public will have forgotten. But, if October's sentence is executed, Bernard Grant will be beyond the reach of human mercy.

Where are the alienists at this juncture? Where is Clarence Darrow with his long and moving pleas for mercy? Where are the millions of the Loeb and Leopold families? Where is the judicial decision that set forth the points in Bernard Grant's case?

All three boys are of the same age—nineteen; but Loeb and Leopold were too young for hanging!

This is no plea for hanging anybody. Hanging is far too final a thing for man to take in his hands; far too horrible a thing for anyone to plead for.

But who will plead for Bernard Grant? Again, *where is Clarence Darrow?* He has defended poor men before, but for rich retainers from unions and other organizations. What can he do, for the sake of the public conscience, in Bernard Grant's case, without a fee?

It is a queer turn of fate that the whole stability of the Loeb-Leopold sentence in the public mind is going to turn upon the fate of a poor boy from "back of the yards."

Religious Prejudice

THERE is no place in the United States for religious enmities. There is a very large place for religious differences, religious activities and religious temper. The truly religious person is usually glad that another person has any religion at all, in these days of thoughtlessness and license; but people who are readiest to fight about religion have least of it. What is meant by the term "religious prejudice" is not always clear. Every person has a prejudice in favor of his own religion, which privilege he ought not to begrudge to others in favor of their own. It is difficult to see how anyone can be prejudiced against another's religion, since so seldom does he know what it is. The whole matter usually resolves itself into plain ignorance and suspicion. Ignorance can be dispelled by knowledge, and by that means suspicion disappears also.

What we need in these days is the religious temper of charity and forbearance. Even churchmen can sometimes show very little of this. Some think that religious bitterness exists only between the Klan and some Catholic organizations, but if they have ever seen into the inter-church fight between the Fundamentalists and the Liberals in Protestantism they would speedily learn that "religious prejudice" is a term of very wide application. Some of the Fundamentalists forget so fundamental a thing as brotherly love, and some of the Liberals belie everything they say by the narrowness of their attitude. A Fundamentalist is one who stays by the foundation spirit, and a Liberal is a man who believes *more,* not less.

There is no kind of Christian activity anywhere, under whatever name, that clashes with another kind of Christian activity. And the Christian spirit is the same in every age and clime.

History

A correspondent sends us this interesting observation:

"IT IS probably too late to deal with the 'Defense' or 'Mobilization' Day question from any new angle but I have just read Major Ganoe's 'History of the U. S. Army,' written, of course, without any premonition that such an event would become a controversial issue and although I lean to the pacifist side the fact obtrudes that after every conflict the United States 'junked' its army.

"Between the Revolution and the War of 1812 the military establishment of the country was allowed to degenerate till the second struggle with Great Britain found us unprepared, nor did the land forces of the United States attain even creditable efficiency at any time during the war. Our salvation from annihilation was either an interposition of Providence or the good fortune attending Britain's entanglements in other directions.

"The war with Mexico revealed the fact that the army and its equipment and training had again practically ceased to be and had to be created anew.

"The early successes of the Confederate armies in the Civil War were, according to this writer, due to the superior attainments of Jefferson Davis, himself a graduate of West Point, and his appreciation of the factors underlying the struggle.

"The War with Spain is still recalled as an episode in American history of which we have no right to be proud, especially of the manner in which it was conducted and the antiquated machinery and equipment with which it was fought.

"Nowhere in the volume does the author pause to moralize on this tendency to hasten the abandonment of all armies and war preparations after every conflict but the facts are glaring as revealed in his dispassionate review of legislative enactments which affected the armed forces of the country, land and water."

John J. Pershing

GENERAL JOHN J. PERSHING has retired at the age of sixty-four years. As yet a man unscathed by the storms of life, and vigorous as an oak, army regulations have made it necessary for him to throw off the khaki of the soldier and don the everyday clothes of the private citizen. But no matter what his outward aspect may be, to Americans he will remain a man *sans peur et sans reproche.*

The code of ethics of John Pershing may be summed up under three heads—In the first place, Discipline; second, Training; third, Preparedness. The logical sequence of these three things in the making of men will be observed at a glance, for there can be no training without discipline, and no preparedness without training.

With him conscientiousness was almost a fetish, and thoroughness was his motto. He has followed the dictum of another great soldier, Wellington, who said: "If a thing is worth doing at all, it is worth doing well." General Pershing, above all things, has been a plodder. His career as a soldier could not by any flight of the imagination be called "meteoric," but his has been a record of work well done and obstacles overcome.

Though a soldier he was not a militarist. But he has never wilfully shut his eyes to impending trouble. "Be prepared" has been his slogan, and *defense,* not *defiance,* his ultimate aim.

Though General Pershing retires into private life through the exigencies of military discipline, the country will feel that "he is there" to aid by his example and wise council those upon whom the responsibility must now fall. It is for him not "Taps" that is sounded, but the "Retreat" which rings forth in the placid atmosphere of a glowing sunset.

Old New Things

PITY the poor "man in the street." Associations of nations, jazz, modern conventions, all jam at him, each sponsored by a sweating enthusiast who hysterically urges instant adoption of his special brand of novelty.

All these modern things are new only to the generation. Other generations embraced them once in their upward climb, only to discard them and pass on.

Perhaps we have swung our culture on past the point where we can endure it in comfort, and are about to return a little way toward ease and freedom of intercourse.

Possibly our music, the best of it, was too heavy for popular consumption, the product of refined taste, built artificially.

It may be that nationalisms everywhere have been case hardened and governments grown cold and cynical. Crude peoples like the Sioux and the Pawnees were able to make treaties and keep them; Germany and France and England could not.

When we have reached and passed the point where government and social forms cease to be blessings and become burdens, it may be as well to seek improvement without revolution, injecting what appears good into our social system, without discarding anything old simply because it is old.

Let's jazz a little, flap moderately, give Paderewski a hearing, remember grandmother's advice to the girls, and observe defense day by mobilizing vehemently, notwithstanding peace conferences.

That's pert Progress, with a gyroscope attached.

Far Too Much!

CANDIDATE DAVIS continues to play in hard luck. His latest piece of misfortune is that Aaron Sapiro has come out in his favor. According to the New York *World,* which prints a dispatch from Knoxville, Tennessee, Mr. Sapiro stated that, after a lifetime of Republicanism, he was going to do everything in his power to help elect Mr. Davis.

True to his method, Mr. Sapiro denounces Charles G. Dawes as a bluffer—whether because Mr. Dawes has at some time or other refused to finance one of the flimsy Sapiro farmer co-operatives is not, of course, disclosed. If Mr. Dawes has at any time outbluffed Aaron, he is indeed some bluffer. One would just hazard the guess that Mr. Dawes has never found time to swap bluffs with the "farmer's savior" from the West.

The fact is, this burden of support is almost too much for Mr. Davis to bear at this time. He should ask that in kindness Mr. Sapiro desist. Woodrow Wilson set a famous precedent by asking a certain gentleman not to support him.

The Place of Sororities in College Life

Are They Worth All the Prominence and Expense?—A Candid Criticism

By JANE FLEMING

The institution of women's Greek-letter societies, known as sororities, has become a vital part of the life of nearly all coeducational universities and also of many colleges for women. The institution has a great effect upon American life and so is worthy the thoughtful consideration first of parents of college women, and also of all citizens interested in education.

THE selection of sorority and fraternity members is the annual picking of the supposed aristocracy of the university and, when it is over, a certain percentage of the students—it is between one-third and one-fourth here at B——— are set apart forever from the mass. They are "Greeks"; the others are "barbs."

The principles of selection are the same for the men's organizations, or fraternities, as for the women's, the sororities; they differ only in detail. The "men"—I know two who "made" a fraternity at the ripe age of sixteen this year—are presumably more able to take care of themselves than the girls. Comparatively few rules are imposed by the university and each crowd is out to cut the others' throats. All want the biggest catches, but failing to get these they take what they can get and make the most of it.

Pin of Sorosis Sorority.

The big catches are of every description. There is always the football hero who never stood a chance until he made his famous touchdown; there are the rich and the socially correct; and then there are always those who must be taken on account of their ability to bolster up a failing scholastic average. It is a rare thing to find a prospect who combines all the prerequisites of money, looks, and brains.

The same standards prevail among the young women Let us examine one of their typical rushing seasons. Here at B——— there are eighteen sororities on the campus with a membership of more than 500. For some strange reason they are as bound by rules as the men are free from them. Back in the days when everything was free-for-all and the devil take the hindmost, "active" girls (that is, in college) with money or wealthy alumnae employed all sorts of means to dazzle new girls into membership in their particular sorority. This, while not unlawful, was not considered strictly ethical even then and the organization of a national council put a stop to most of it. Very specific rules cover these situations such as:

"Automobiles shall not be used to transport rushees.

"No sorority girl shall meet at trains, entertain or help register a new student, or appear with her on the campus until rushing season closes."

Pan-Hellenic, the national council, is a body composed of a representation from each sorority. It has many rules and penalties and every member of each sorority is a deadly female detective watching all other sororities for the least misstep. Penalties are so severe and so sure to be imposed if the offense is proved that there is very little infringement of rules.

Sorority-rushing at B——— lasts ten days and embraces eight set affairs. The first is a huge afternoon tea and all the eighteen organizations are obliged by Pan-Hellenic to entertain on the same day and in exactly the same way. However, with sororities as with individuals, some do the same thing with more of an air than others: there is no fine for that.

As this tea takes place about a week before the autumn semester opens, one may wonder how it happens that the guests are in town, for they decidedly are. Fathers may have objected to the useless expense of an extra week in B——— but no matter. The mothers are determined allies so here they are, nervously ready to "snap into it." Their clothes are as near the last word as they were able to manage and every girl has a well-rehearsed line.

Delta Gamma House.

Their names have been secured by devious routes but chiefly by a sort of intelligence system that covers the secondary schools practically all over the United States. B——— draws students from every state in the Union and the alumnae keep their ears to the ground.

Though this tea does not take place until September, many of the invitations are sent out as early as the preceding June; in fact, the list is usually in preparation for a year or two in advance. Some of the larger sororities invite as many as 250 to this first event, though they may not intend to take in more than twenty new members. They have to "look 'em over."

A well-advertised girl will be asked to every one of the eighteen houses and no matter how loftily she may look down upon the small fry among them, she accepts them all and arranges her time accordingly. It is the way it is done at B———. Around five o'clock the Big Four are a jam as everyone wants to be seen there at the most auspicious time.

The night after the tea a kimono-clad roomful of members dissects the list and reduces the guests by at least one-half for the next party. Pigtails and cold cream prevail early in the evening, for men know that for once in their lives they are neither expected nor wanted as callers until the "rushing season" is over.

"We don't want her. There's just something about her—you know what I mean," is often as lucid a reason as is needed for a girl to be dropped.

Others go into the discard because in the crush of a big tea no one seems to be able to remember anything about them.

Martha Cook Dormitory, University of Michigan, fine residence hall for women, of a type now found in a number of large universities. This type of hall has done much to give the independent woman a place of equality in the university with sorority members.

Gamma Phi Beta Sorority House, University of Michigan. Frequently the top story is used as a dormitory in these houses, having in the upper story twenty or thirty beds.

Alpha Chi Omega Sorority House, University of Washington, Seattle, Washington. Type of sorority residence found in many large universities.

"How about Alice Jones?" says the rushing chairman reading from her list. "We sent her an invitation. Was she here?" No answer.

"Didn't any of you see her?" Another silence.

"What did she look like?" ventures some one finally.

"Gee whiz, how do you suppose I know? I never saw her," snaps the chairman who, during these hectic days and sleepless nights, is a person to be handled with care. "O, well, let's drop her. We've got loads of marvelous girls to pick from anyway. Let's see who's next," and they go on leaving Alice Jones to wonder all through college what it was they didn't like about her.

A beautiful and animated girl is sure to survive this first event and have further inspection because she will have made a pleasant impression on everyone. Also the daughter of a distinguished family will be sure to register because she will have had much advance consideration. Other girls may or may not. Chance plays a big part here.

The day following the tea, invitations are sent out for the next four events, two luncheons and two dinners. A popular girl may be invited by all eighteen to all of these and every girl is notified in her invitation that she is expected to pay for all the affairs she attends. It may seem an odd form of hospitality to some, but they gladly drop the fee in the little box at the door.

The most popular girls will probably not give to any one sorority more than one, or at the most two, of these engagements nor will a less popular girl who "knows her stuff." The former is too rushed and the latter does not wish to appear overanxious. Many a girl has cast the die in her own favor by knowing just the diplomatic mean between indifference and eagerness.

Another drastic cut is made after these parties and still another after the tea which follows them. There remain now only two affairs, an informal and a formal dinner, and any girl who is asked to these may be sure she is being seriously considered for membership.

The last party is a gorgeous one. Every girl has on her best gown, new and fashionable; the shaded lights are "adorable"; the dinner is "wonderful"; and the orchestra, while it might not appeal to older ears, is "simply marvelous" to these.

Dancing lasts until ten minutes to eleven, which is the lawful time limit, and the hegira begins as suddenly as the flight of Cinderella. Self-government associations, deans, and other horrors have a way of finding out things. Then, too, the iron hand of Pan-Hellenic may be just around the corner with its ever-raised ax ready to cut off all privileges for infringement of rules. This is the greatest horror of them all.

The fight is on as soon as the last guest has been taken home and more often than not it lasts till daybreak. Some names "go through" without a protest. Others who are just as acceptable are held out on by Nancy Brown, let us say, because they happen to be protégées of Sally Smith, who in turn is holding out on Nancy Brown's plain-looking sister, friend, or forty-second cousin.

There are floods of angry tears and biting little words, but a trade is usually effected in the course of time so that the next name can come up.

Sally Smith may have stopped holding out on Nancy Brown's plain offering, but deep in her little heart she is already consigning her to the "cellar gang." This is the group which either stays away from parties or else makes up the personnel of the wallflowers. They are "in" by virtue of their grades or their relatives but there is no thrill for them inside their own walls where their position is on a level with that of the furniture.

Back home and outside among the "barbs" it is a different story, of course. The little gold pin so carefully-carelessly pinned to the sweater front proclaims their achievement, and anyone who has been to college and was "in" will not mistake it for the emblem of a literary society.

The real anxiety only begins when the list for bidding is complete. There is sufficient chance for crooked work so all bidding at B——— is done through the office of the dean of women. The two days following the formal party are days of silence during which all intercourse between sorority and non-sorority women is strictly forbidden.

Everyone from university president to butcher's boy knows these days when the air is electric with waiting and half the university seems to be turning round and round on the spit of suspense.

On the first day each sorority sends to the dean's office a list of the girls it wishes to bid. From all of these lists, one list is made up containing the name of every girl desired by any sorority and a preference slip is made out and taken by special messenger to each of them. A receipt is given to the messenger by the rushee who then writes on her slip the names of the organizations she would be willing to join, in order of her choice.

The day following, these preference slips are checked and lists of acceptances are made out for each sorority. A formal invitation to join is then written for each name on the list and delivered immediately into the girl's hand. Pledging ceremonies take place a few hours later.

In the fraternities the agony is long since over. Having few set rules they proceed on the slap-dash method of "rush 'em off their feet, pull 'em in and pledge 'em" and it is all over before you can wink an eye.

Inside the house there is a mad orgy of hugging, kissing, weeping, and singing. Not everyone is suited with the new girls but an outsider could never tell it nor can the girls themselves, and they emerge a few hours later wearing little knots of colored ribbon and with their bosoms swelling with pride. They have made the grade!

And how about those who were entertained, flattered, and invited to everything and then on bidding day saw the big square envelopes going to other girls' doors but never to theirs? If they are philosophical they realize that the future can hold no terrors for them in the way of social rebuff. They have touched bottom.

There is a dash and brilliance to the doings of the "Greeks" that is sadly lacking in the open student mixers and they all want to be part of it, the men just as desperately as the girls.

Many every autumn go back home unable to stay and

The First Woman Physician in China

How a "Venerable Devil" Was Transformed Into a Ministering Angel

By MRS. L. M. CRAMER

WHEN one is young and pretty and has been made much of, one would naturally feel somewhat aggrieved to be greeted with some such greeting as this: "Kuei tze lao yeh hao?" and especially if one were a young woman who had deliberately closed her eyes to a possible brilliant future back home, to devote her life to the medical care of a foreign people. That is the way Miss Minnie E. Sinclair felt back in the late eighties when she went to China as a medical missionary, for she was young and pretty, and, translated, the greeting is "Is the venerable devil well?"

Miss Sinclair was one of the prettiest girls ever graduated from the medical school of the University of Michigan, and she had pledged her life to the work of a medical missionary in foreign service. It so happened that she was sent to China where she remained for twenty-five years, during all this time being stationed in Pekin. There, after a time, she met Professor Isaac Headland of the faculty of the University of Pekin, and they were married. But that, as Kipling would say, is another story. For the rest of the article, we will speak of her as Dr. Headland.

Dr. Headland and Princess Yu, the best informed lady in court matters of these higher classes. Princess Yu is seated in the center of the picture next to Dr. Headland.

Dr. Headland was the first woman physician in China. Today she laughs at her early chagrin, and at the tears of anger and hurt pride she shed, feeling that such a title—"venerable devil"—was but poor return for all she was trying to do for this alien people. Later on she was to learn that the title thus bestowed was one of admiration and high respect rather than one of dislike. But when she remonstrated with them over the name they had called her, they plaintively asked, "Then what can we call you?"

Dr. Headland had literally to cure her way into the hearts of the Chinese people, but she won her spurs, and later became physician to the women of the nobility, for in those days China was an empire.

This intrepid woman had her own hospital, located in Duck Alley. To Occidental ears "Duck Alley" smacks of the slums. Not so in the Orient and especially in China, for it happened to be located in the most aristocratic section of Pekin, not a stone's throw from the palace of the father of the Emperor, Prince Chun, and but a square away from the famous Drum and Bell Tower, in which hangs one of the largest bells of the city, and around which is woven the tragic story of a beautiful young girl's devotion and sacrifice—which is still another story to be told later on in this article.

Speaking of those first months in China, Dr. Headland frankly admits it was just a little bit awful, but she later grew to love it, and would still be in China had not Professor Headland's health made imperative their return to America a few years ago. At first only the very poor women came to Dr. Headland's hospital for treatment. In those days the Chinese physicians were not surgeons, and Chinese women were never operated on by a man surgeon, whatever his nationality. There was great need for surgery, Dr. Headland found, and especially among the women of the poorer classes. "There were tumors by the hundreds coming to my attention, and cases of decaying bone and cancers without number, it seemed," said she. "There was need for all I could do and my first work was largely surgery and the treatment of affected eyes."

The surgical work appealed to the people—they could see the results. The first surgical case she had, made a fine recovery, and that brought her other cases, and finally people of the better classes began to send for her.

Shortly after she arrived in China, a man came running to the hospital, and falling before her he touched his head three times to the floor, crying, "Shin ming!" (Save life.) She found that a poor woman had attempted to kill herself at the "yamen," a place somewhat like our police station, where the officials of the town are housed. Dr. Headland took her emergency case and rushed to the "yamen," but a short distance away, where she found the woman lying in a pool of blood, at the feet of an officer. She had fainted and the officials, thinking her dead, were ringing their hands and crying to Dr. Headland to save her. When the doctor ordered them to remove her to the interior of the house, that she might operate on the gaping wound in the neck where the poor woman had cut her throat, there was objection. No one was willing to touch her for fear her spirit would enter their bodies. Dr. Headland had to pledge her word that the woman was alive and would not die while they were lifting her before they would touch her. The doctor dressed the wound and started to sew it up, when they set up a mighty protest: she was not cloth to be sewed, they said. In those days a Chinese doctor never sewed up a wound; instead he would fill it with a mixture of alum, ground rhinoceros horn and incense ashes. If the patient died from blood poisoning, they wondered why.

"I wanted to take the woman to the hospital where she could be properly cared for, but was met with refusal unless I would go security for her recovery. I could only promise that I would go security that she would die if I did not take her, and met with no further difficulty in getting her removed. She recovered and brought me many patients from the families of those men occupying political positions in the city," said Dr. Headland.

Some time later, Dr. Headland learned the occasion for the great interest taken by these particular officials in the woman she was called to treat. It seemed the Chinese woman owned a small parcel of land. Surrounding it on all but one side was land owned by a wealthy Chinese who wanted to buy the woman's land. While she was willing to sell, she was unwilling to do so at the price the rich man offered, so the man of wealth trumped up a charge against her and took it to the officials who decided in the man's favor. In China, if you can't get redress for a real or a fancied wrong, you can commit suicide at the feet of the official whose ruling has kept you from your rights. Such an act will start an investigation into the life of the official. Of course, in many instances the official is made to suffer, but in the meantime you are dead. However, in China, if you have an enemy you can always get even with him by committing suicide on his doorstep.

But there was a happy ending to this particular woman's story. She recovered and in due time received from the official at fault more than the amount of money she had asked for her land and she was happy. The morning the patient was to be discharged from the hospital, Dr. Headland heard the sound of music approaching. It was a band preceding a high official, who was coming to the hospital. One of the official's outriders carried a lacquered tablet, with a lauditory message written on it in gold, reading, "To the foreign doctor who could raise the dead to life."

The gentleman was dressed in his official robes, and his servant carried a red satin cushion, which he placed at Dr. Headland's feet. Upon this cushion the official knelt and struck his head three times to the ground, and then departed, leaving the tablet with the doctor.

After that experience Dr. Headland was more and more frequently invited to the homes of the local magistrates. In many of these homes she was the first American woman the Chinese women had seen, and it was here they greeted her with, "Kuei tze lao yeh hao?" Their social recognition brought with it a certain professional recognition, but they received her with some fear when her call was professional and many a time when she was called to see a patient of the better class, the Chinese woman would keep her eyes tightly closed all the time she was in the sick room. That was because she feared, if she opened them, she would "swallow her breath"—the Chinese term for dying.

About five years after she went to China, came Dr. Headland's entrée into one of the great houses of Pekin. She was returning to her hospital one day when her house boy ran out to tell her that a "tajen," a great man, had been to see her and wanted her to come to his house right away. He was a member of the central government, and she went in state. The man, garbed in his official robes, met her at his office, and, according to Dr. Headland, there was no more imposing sight in the world than a gentleman of China, thirty years back, dressed in his official robes. He seemed to radiate a dignity and a greatness that no official robes of any other country could bring. He told her that his wife had been dying for five days, despite the fact that the best midwives of China had been brought to her. They had all given her up. In a splendid cart, upholstered in satin, they drove rapidly to the man's home.

There they found the suffering woman, in beautifully embroidered graveclothes, laid out on the death couch, waiting for the breath to leave her body. She was not allowed to lie in a Chinese bed, as then her spirit might stay there. Instead, she was placed on the death couch, her feet toward the door, for the spirits like to be near the door so that they can make a straight line out of it.

She was a beautiful young woman and Dr. Headland was determined to save her life, and did. Because she had no one trained to act as nurse in such a case, the doctor was nurse also. Today in Pekin there are training schools for nurses in connection with the mission hospitals, where the most capable and devoted nurses in the world are trained. Today, also, in connection with the hospital of which Dr. Headland was head for so many years—1887 to 1912, when she returned to this country—there is a woman's medical school.

From that time on Dr. Headland was called to the homes of the princes of China to attend their wives and children, and the last dozen years she spent there she was in constant demand at the homes of both the imperial and the hereditary princes in the capital. Once she was called to treat the late Emperor's father, Prince Chun. He was very ill and sent for Dr. Headland, but the mission feared it would cause unfavorable comment and withheld its permission, and so Dr. Headland did not treat the venerable man.

"I found the ladies of these princely homes very delightful," said Dr. Headland. "They opened their homes to me, and they came to mine. Princess Shum, a sister of the Dowager Empress, Princess Yu, and the Mongolian Princess, Ka-la-chin, were among my dearest friends there."

Some of Dr. Headland's experiences in giving chloroform in cases where the necessity arose were very amusing, and also very serious. The Chinese looked upon the drug as something to fear greatly, and the administration of it was considered an act of magic. The patients never submitted to an anesthetic nor an operation till after the "necromancers"—spirit doctors—had taken a trip to the "underworld" to investigate.

Dr. Headland had hard work to save the patient, so great was the Chinese fear that the demons and the spirit doctors had told the truth, and very often patients demanded of her that she should go security for their recovery.

The hospital was situated in Duck Alley, as has been said, amid beautiful surroundings. On one side it looked out upon a small lake, the waters of which in certain seasons were fairly covered with lotus flowers. The famous Drum and Bell Tower, in which a great bell hung, overshadowed it.

This is the tradition of the Drum and Bell Tower's deep, perfect-toned bell, and in China an interesting story surrounds every bell tower, and every bell of note:

At the time of the Emperor Yung La, in the fifteenth century, the emperor gave a command to cast a great bell. The bell was not perfect and the emperor refused it. Again a day was set for the casting, again there was great feasting, and again the bell was found to be imperfect. Then the emperor became very angered and ordered a third bell cast, a third feast prepared, but this time he said if the bell turned out imperfect, he would order a certain high official beheaded.

This certain high official had a daughter, a beautiful girl, devoted to her father. She went to a Chinese soothsayer and asked what she could do to save her father's life. The old woman told her that unless the blood of a virgin be mixed with the molten metal when the bell was cast, the third bell would be no more perfect than the other two.

So the feast day drew on apace, and preparations were made for casting the third bell. The great caldron was placed in position, and seats, like grand stands, built overlooking it. On these seats the nobility were to be seated. The daughter of the threatened official sat overlooking the great pot. When the bell was about to be cast, the maiden threw herself into the seething mass of metal and gave her life that her father's might be spared. The blood of a virgin had been mixed with the molten metal, and the bell was perfect, with a rich, mellow tone.

But as the maid threw herself into the caldron an old woman grabbed at her feet. She clutched the maiden's shoe, and the shoe came off in the old woman's hand. So, each evening, as the bells ring out the hour to close the great gates of Pekin, the old women of Pekin cry out, "Hsieh, Hsieh."—"She calls for her shoe. She calls for her shoe."

This Rancher Once Ran a Rattlesnake Store

Old-Timer Tells of the Hell-Roaring Days When the West Was Wild and Woolly and Adeptness With a Six-Shooter Was a Most Valuable Asset

By
GEORGE
H. DACY

Diamond Back rattler ready for a battle.

IN THE days when Arizona and New Mexico were the practice grounds for ranching, prospecting, stock-running and outlawry, two important articles were found among the equipment of most every horseman who rode the plains and highlands.

A well-oiled six-shooter strapped in a holster to the belt of the cowman, rancher or prospector was his chief means of defense against human enemies. A rope about thirty feet long made of horse and cow hair was carried coiled on his saddle and used as a lariat and source of protection against rattlesnakes at night.

Now do not make the mistake and think that the homespun lariat was used for lassoing poisonous snakes, for it has been but rarely that a rope has been devoted to such a purpose in the West. A century-old tradition of the range country is the belief that one of these hair ropes looped around the spot where the westerner sleeps rolled in his blankets is an efficient safeguard against rattlesnakes.

Thousands and thousands of cowboys, packers, trailers, trappers, Indian scouts and soldiers have availed themselves of this precaution during the countless nights that they have slept stretched out on the ground with the stars in the sky as the illuminators of their outdoor bedchambers. The supposition has been that the rattlesnake would never pass over a hair rope. Like the origin of many another superstition, the birthplace of this one has never been found.

Will C. Barnes, of Washington, who has charge of the grazing of 10,000,000 head of livestock on the 110,000,000 acres of range in our national forests, is the first man to test out and disprove this theory. This man Barnes at one time or another has experienced every thrill and danger which the Far West has to offer. Forty four years ago, he was military telegraph operator at Fort Apache in the heart of the most dangerous Indian territory in Arizona. Soldier Barnes was awarded the Congressional medal of honor for running the Indian lines on one hazardous occasion and bringing back succor to the garrison which was surrounded by bloodthirsty savages.

Thereafter, Barnes served as a cowboy and made the mighty leap from cowpuncher to wealthy rancher. His 7,000 head of cattle ranged a territory of 200 square miles. He served in the Arizona state legislature for one term. A terrible drought ruined his herd and the influx of sheep ranchers forced Barnes to migrate to New Mexico. In those days, New Mexico was the wildest and woolliest part of our western frontier. The territory was a dumping grounds for outlaws and outcasts of civilization. The Texas Rangers drove the riffraff of the Lone Star State into New Mexico. The sheriffs in Arizona chased their criminals and bandits over the state line. It was under these turbulent conditions of hell-roaring ranch life that Barnes lived, won success and was elevated to the position of assemblyman in the New Mexico legislature.

Will Barnes was once a member of a posse that pursued some of the most desperate gangsters of the notorious "Al" Jennings band. On this search for four hours one day an outlaw kept his rifle pointed at Barnes' heart, waiting for the rancher to step over a certain mark. Barnes knew nothing of the hidden cave in which the criminals were concealed. He passed close to their ambush but did not step over the imaginary line which the leader of the gang had specified. That was the closest call to death which Barnes ever experienced. It was not until years after when the outlaws were finally rounded up that Barnes learned of the unseen danger that had threatened him.

It was while living in Arizona that Will Barnes, well-acquainted with the friendly Hopi, Navajo and Apache Indians of that region, opened an extraordinary curio shop. He specialized in the sale of Indian basketry, blankets, moccasins and other art work. One day an Indian brought in a couple of rattlesnakes. Barnes had no use for the reptiles but being afraid to offend the red man he finally purchased the rattlers at twenty-five cents apiece. This Indian told all his friends about the sale. Soon Barnes was overrun with rattlers. He was literally forced into the rattlesnake business as a side line.

There was but one possible outlet for the profitable marketing of the dangerous reptiles—to advertise in some eastern magazine. That is what Barnes did. As a result, he sold thousands of rattlesnakes to scientists and showmen in all parts of America and in most of the foreign countries. He capitalized on a novel opportunity and made a successful go of the snake-selling enterprise. In time, he added Gila monsters to his market menagerie. It was seldom that the Barnes store had less than a dozen Gila monsters and a half-hundred adult rattlers on hand.

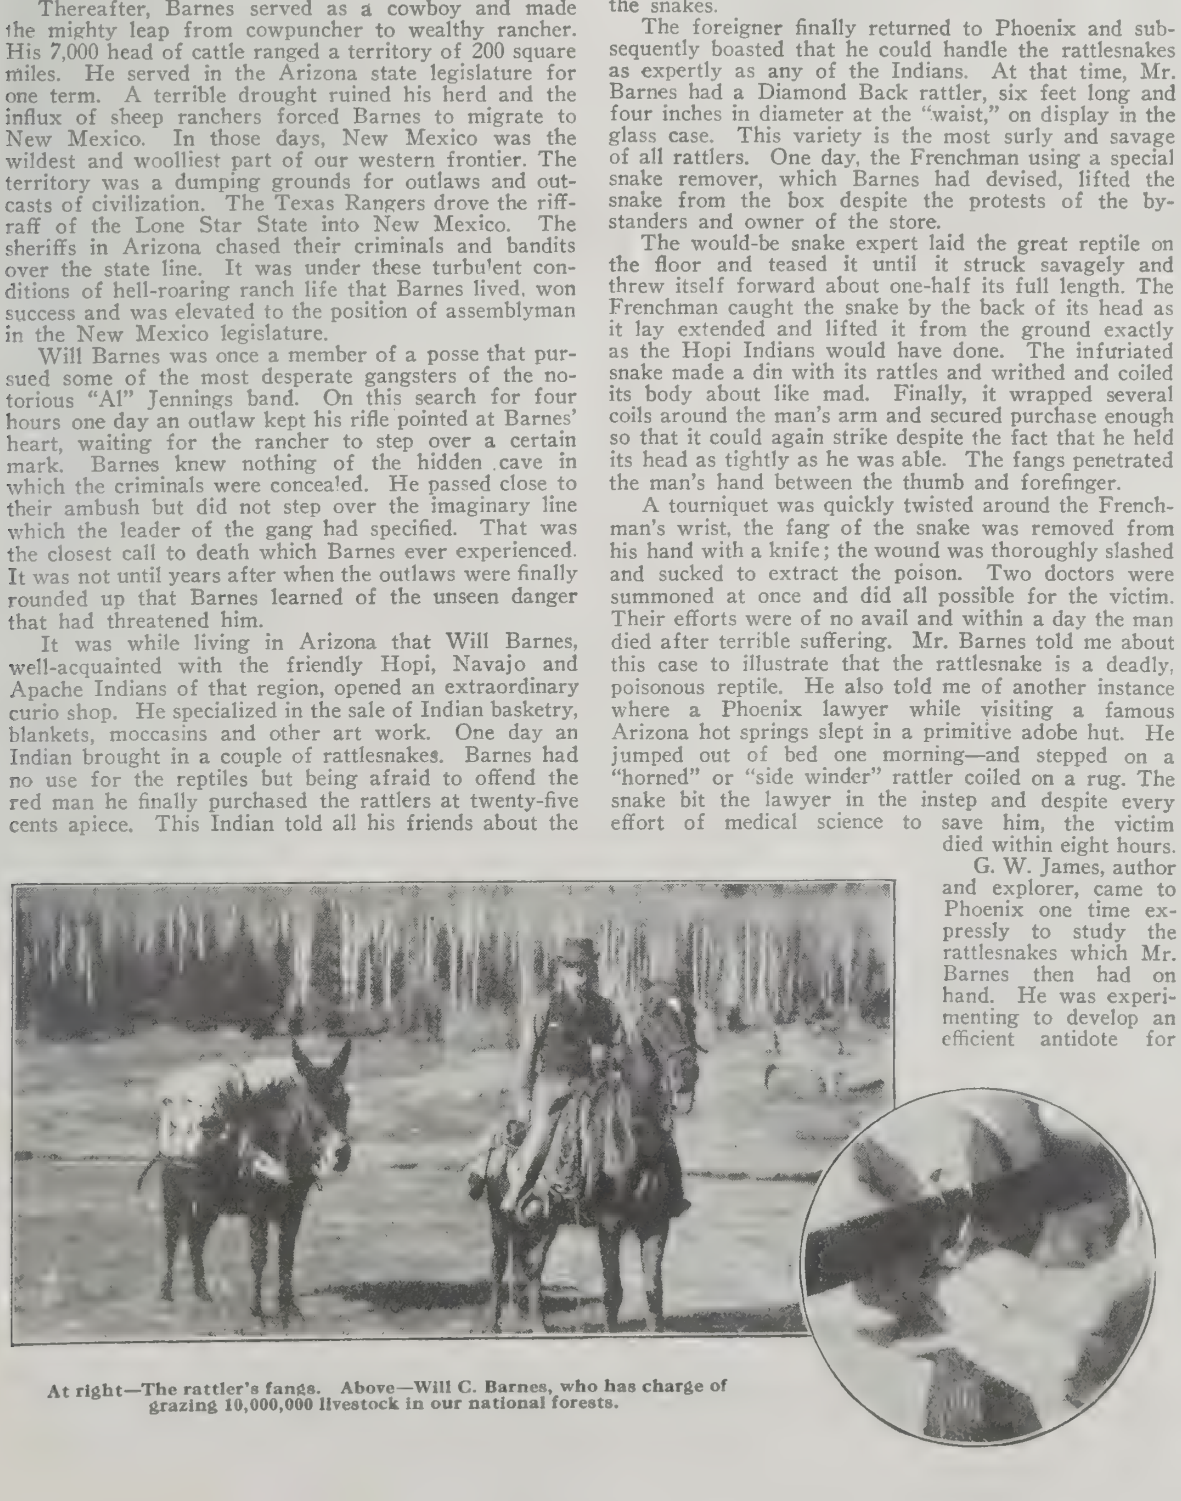
A half-dozen of the largest and finest rattlers were displayed in a glass case in the front of the store, the balance of the reptiles being kept out of sight in secure cages. Will Barnes latterly told the writer about a Frenchman, an amateur naturalist and scientist, who came regularly to the shop. The Frenchman visited the Hopi Indian Reservation during their celebrated snake-dance ceremonies and there carefully studied the methods which the redskins used in handling and charming the snakes.

The foreigner finally returned to Phoenix and subsequently boasted that he could handle the rattlesnakes as expertly as any of the Indians. At that time, Mr. Barnes had a Diamond Back rattler, six feet long and four inches in diameter at the "waist," on display in the glass case. This variety is the most surly and savage of all rattlers. One day, the Frenchman using a special snake remover, which Barnes had devised, lifted the snake from the box despite the protests of the bystanders and owner of the store.

The would-be snake expert laid the great reptile on the floor and teased it until it struck savagely and threw itself forward about one-half its full length. The Frenchman caught the snake by the back of its head as it lay extended and lifted it from the ground exactly as the Hopi Indians would have done. The infuriated snake made a din with its rattles and writhed and coiled its body about like mad. Finally, it wrapped several coils around the man's arm and secured purchase enough so that it could again strike despite the fact that he held its head as tightly as he was able. The fangs penetrated the man's hand between the thumb and forefinger.

A tourniquet was quickly twisted around the Frenchman's wrist, the fang of the snake was removed from his hand with a knife; the wound was thoroughly slashed and sucked to extract the poison. Two doctors were summoned at once and did all possible for the victim. Their efforts were of no avail and within a day the man died after terrible suffering. Mr. Barnes told me about this case to illustrate that the rattlesnake is a deadly, poisonous reptile. He also told me of another instance where a Phoenix lawyer while visiting a famous Arizona hot springs slept in a primitive adobe hut. He jumped out of bed one morning—and stepped on a "horned" or "side winder" rattler coiled on a rug. The snake bit the lawyer in the instep and despite every effort of medical science to save him, the victim died within eight hours.

G. W. James, author and explorer, came to Phoenix one time expressly to study the rattlesnakes which Mr. Barnes then had on hand. He was experimenting to develop an efficient antidote for rattlesnake poison. Finally, Mr. Barnes consented to allow the scientist to extract some poison from the reptiles. The snake owner tells what followed:



At right—The rattler's fangs. Above—Will C. Barnes, who has charge of grazing 10,000,000 livestock in our national forests.

"Mr. James grabbed an active Diamond Back rattler five and one-half feet in length from the cage. The snake showed fight. It opened its mouth to the uttermost extent, the jaws almost at right angles to the body, the ugly fangs unhinged and erect, the enveloping sheath slowly receding from them. Meantime, the snake apparently was slipping slightly through the scientist's thumb and finger which encircled its head. Suddenly, with lightning-like rapidity, the rattler gave its head a peculiar twist which threw the upper jaw into such a position as to allow it to make a sideswipe at the lower part of Mr. James' thumb. Only one fang touched the flesh but so strong was the stroke that the needle-like weapon tore a sliding gash an inch long and three-quarters of an inch deep in the member.

"James did not lose his nerve but retained his tight grip on the snake's head which he manipulated in such a manner as to enable him to secure one-half a teaspoonful of poison from one fang. This poison he placed in a tiny vial. His thumb and wrist were drenched with the poison but he showed the spectators that it had come entirely from the fang that caused the wound. He pried the snake's mouth open and pointed to the empty poison sack on the one side and the full one on the other. Previously the common belief had been that the ejection of the poison had been involuntary so far as the rattler was concerned—that every time the rattler struck and sank its fangs the poison streamed into the wound. Scientist James contends, however, that the snake absolutely controls the ejection of poison.

"Wounded though he was, the scientist in James was stronger than the fear of a fatal result. It was not until he finished his scientific inspection that he tossed aside the rattler and submitted to having the wound dressed. A tourniquet was placed above the elbow. Liberal applications of permanganate of potash and very hot water were then flooded over the wound. Bluish discoloration soon set in accompanied by terrific pains and soreness. For several days James was very ill and it was two months before he regained full use of his hand and arm. The after-results were singular. For the next eighteen months, James' stomach swelled and solidified every sixty to ninety days. For several days the scientist would suffer great agony and then the pain would cease. It was only after taking a course of mud baths at a famous mud springs that the attacks ceased."

Another strange case of the after-effects of snake poison is recorded in the records of the Smithsonian Institution at Washington. One of Uncle Sam's employes was bitten on the finger by a small coral snake. The man suffered great pain for several days and then seemed to recover. For the next twelve years, however, on the date of the original snake bite, the pains returned, a sore formed and burst on his finger and the nail finally came off. Ultimately the scientist tried out a Brazilian snake cure—an infusion of the leaves and stems of a certain herb being taken internally before the anniversary of the injury. This stopped the sores and loss of the nail but the pains still continued until the man died.

There is a case on record in Arizona where a rattler bit a Mexican boy. The lad lost his power of speech as a result. Each year on the date of the original bite, he would wander away to the desert where he would play with bugs, toads and lizards. For a day or so the boy seemed to lose his mind and forget all humanity. It is quite likely while in his subnormal condition he handled and played with dangerous snakes.

Mr. Barnes' familiarity with rattlesnakes has made him an amateur authority on those reptiles. He says that the fangs of the rattlers are sharp as needles and are hollow. The poison is forced from the storage sac through the thread-like opening into the wound made by the fang. Doctor S. Weir Mitchell, an eminent expert on rattlers, reports that the snakes usually carry eight to ten reserve fangs. The hiss of the rattler is caused by the air expelled from its body due to the violent muscular movement it makes in casting its body

(Concluded on page 14)

Gambling With Death—What 'Bootleg' Means

Washington Discloses Some of the Horrors That Lurk in the "Moonshine"

By DEL MARQUIS

A 2,700-gallon still captured in Tennessee. Note the location of the still, the ramshackle shed in the backwoods.

ARE you fond of taking a chance—one with long odds? Drink some bootleg liquor. The odds are ninety-nine to one against you, for out of every one hundred bottles of liquor sold as real whisky or gin, only one has any legitimate relationship to real liquor. The other ninety-nine are noxious, unwholesome, semi-poisonous synthetic stuff.

Would you drink from one of a hundred bottles, if you even suspected that one of them contained a violent poison? You would not. But you will pay a bootlegger an outrageous price for the privilege of drinking his poisonous concoctions which may ruin your eyesight, destroy your health and possibly cause your death.

These are not the ravings of a fanatic. They are substantiated by facts, chronicled in the daily press, recorded in the coroner's records, and evidenced by analyses of seized liquors in government laboratories. During the last fiscal year out of approximately 90,000 samples analyzed by the government laboratory at Washington and its nine branch laboratories in Buffalo, Chicago, Columbus, Little Rock, New York, Minneapolis, Philadelphia, Providence and San Francisco, only one per cent was found to be genuine.

The traditional toast, "to your health!" has a subtle irony when pledged in the liquor available in the United States today. "One drink—you're drunk. Two drinks—you're blind. Three drinks—call an undertaker," is the way one well-known magistrate characterized it. In the Washington laboratory, which occupies a large portion of the fourth floor of the main Treasury Building, is a large room with shelves reaching to the ceiling. Row on row of evil-looking concoctions bear mute testimony to the perfidy of the bootlegger. Here and there will be seen a dusty, moldy, long-necked bottle wrapped in tinfoil, bearing the label of a well-known brand, and containing the "real stuff," although William V. Linder, the chemist in charge, assured me that a label is no criterion to go by as almost every brand of label known in the United States, whether domestic or foreign make, has been imitated and sold by the tens of thousands. There were many other bottles and jars filled with a darkish, cloudy liquid, with several inches of sediment in the bottom. Upon removing the lid of one of the jars, a sickening odor permeated the room, which Mr. Linder said is characteristic of present-day liquors. The sediment, he explained, was simply filth carried over from the mash during the distilling process, because the moonshiner, usually an ignorant, unskilled tradesman, lacks the technical knowledge of distilling. He lets his mash ferment in unclean barrels, washtubs, and other similar receptacles, in dark, musty cellars, or in the open backwoods. Under such conditions, the development of wild yeasts or unwholesome fermentations are inevitable. Dirt and vermin feed upon unprotected mash, but as long as foreign and filthy matter can be camouflaged by adding a tasty flavoring the stuff will bring its price. Many moonshine mashes show evidence of actual putrefaction, he said, and the samples amply bear out the assertion.

R. A. HAYNES,

Federal Prohibition Commissioner.

"The moonshiner and home distiller have no scruples regarding the health and life of their customers, neither do they have the facilities with which to work or the necessary time to produce a drinkable product," said Mr. Linder. "Orders are taken one day, the stuff made during the night, and delivered the next day. The illicit manufacturer wastes no time in aging his product, which helps to eliminate poisonous products of fermentation. Stills are hastily set up, often in swamps under most insanitary conditions, far from the source of water supply and practically inaccessible in many cases. The modern moonshiner possesses none of the good qualities of the moonshiner of old, but has all the vices of his predecessor plus a lot of city-bred vices which the old-timer would have considered illegal and unmoral, to say the least.

"Even pre-prohibition whisky, when first made, was colorless, nauseating and deleterious, in spite of the extreme care which was taken by professional distillers to make a pure product and the delicate tests which were performed to make certain that the liquor contained no extraneous substances which would bar it from receiving the government label under the Federal Health Law. However, following the aging, it became mellow and palatable and fit to be used as a beverage.

"The generally recognized knock-out constituents of moonshine whisky, such as fusel oil, aldehydes and other products of fermentation other than ethyl alcohol, remain in the whisky because it is not aged. It is made one day and drunk the next, while to make good whisky aging from four to eight years is required, as the longer it is aged, up to a certain point, the less organically harmful it is. These poisons are cumulative and remain permanently in the system, frequently producing a condition of stupor which resembles drunkenness, but without the exhilarating effect for which the liquor is taken. Other results are depression of respiration, tetanic convulsions, muscular relaxation, destruction of tissues, action on the central nerve system, and finally death if taken frequently.

"Moonshine liquor often contains metallic poisons, due to the practice of bootleggers of peddling it in fruit jars which have zinc lids. The acids in the liquor form what is known as zinc salts, the drinking of which causes acute gastritis and other serious ailments. The presence of these salts cannot be detected by taste alone, but a thorough chemical analysis is necessary, which the average drinker can neither afford nor considers essential.

"The almost inconceivable conditions under which moonshine whisky is manufactured lend further elements of danger in its consumption. The illicit still by its very nature must be clandestine. It hides itself in thickets, fields and barns. The containers consist of old barrels, rusty ice-cream cans, galvanized oil cans, milk cans, wash boilers, and other metal vessels, unspeakably filthy and ill-smelling after repeated use without cleaning. The unprotected fermenting mixture attracts animal life of every description which feeds upon the material and often drowns in it. The materials used are of the worst, and even though it were possible to procure a pure yeast culture, the contamination produced by wild yeasts and bacteria would result in poor fermentation. The principal ingredients of one batch of liquor mash confiscated by raiding agents were lemon and orange peelings and watermelon rinds which had been taken from garbage cans, the water used being pumped from a pool into which the garbage had been dumped. Concentrated lye is sometimes put in the mash, thus reducing the period of fermentation six or seven days, and increasing the number of deaths from poisoning alarmingly. Hydrofluoric acid is sometimes used to stop fermentation at a given point. Illicit wine makers have been known to add permanganate of potash, a deadly poison, to freshly made wine to give it the appearance of age. With these deadly poisons put into the mash, who can wonder at the strange burning sensation or at the deaths which occur after the use of whisky thus made by unscrupulous persons?"

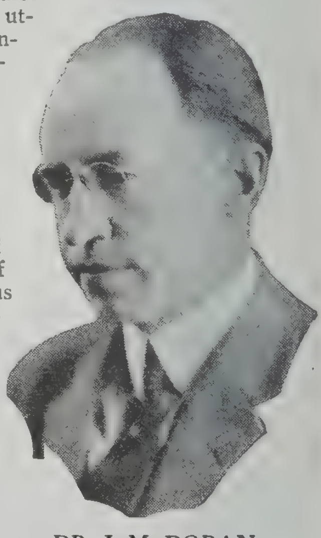
Illustrating the filthy and revolting conditions which agents have found, the case was cited of a still located in a foul cave, dirt and trash covering the earthen floor, wherein were seventy barrels of mash, the tops laden with flies, insects and vermin of various natures. To reach the cave it was necessary for the officers to climb on pack horses, up a large hill heavily covered with brush and timber, while buried in shallow graves beneath the brush were many dead animals, placed there so that their odor would counteract the heavy fumes of mash and whisky. There was no entrance to the cave sufficiently large to permit the entrance of a good-sized man, unless timber and brush were first removed.

The simplest expression of a still ever reported to prohibition officials consisted of a common boiler covered with a filthy blanket, the alcoholic vapors rising from the boiling liquid being retained in the blanket and then wrung out of it into a bottle, doubtless bearing a label declaring it to be "bottled-in-bond." In another instance a torn-up mattress furnished the necessary cotton for straining the finished product.

"The man who puts poisons in perfumes and hair tonics" is the way Dr. J. M. Doran, head of the Industrial Alcohol and Chemical Division of the Prohibition Unit, was once described by a would-be interviewer. Dr. Doran is the man who develops the formulas under which grain alcohol is denatured and rendered unfit for beverage use. Next to moonshine, he says, the liquor most commonly dealt in by the bootlegger is made from redistilled denatured alcohol, a non-beverage liquor intended for industrial uses, consisting of pure grain alcohol to which has been added various poisons rendering it unfit for beverage purposes.

Two-thirds of the alcohol produced in the United States, which in the fiscal year ended June 30, 1923, was more than 121,000,000 proof gallons, is denatured and used mainly for technical purposes. The redistillation of this denatured alcohol and the dilution, flavoring and coloring of the resultant product is a continual menace to the nation, Dr. Doran said, for the reason that it is impossible to remove the poisonous denaturants. Theoretically it is possible to recover pure grain alcohol from the denatured product, which is what the bootlegger attempts to do, either by redistillation or by neutralizing the poisons. Almost without exception the bootlegger is without chemical knowledge or training and the delicate and complicated process by which pure grain alcohol may be recovered is beyond his powers. Although he may succeed in removing most of the foul taste, so that when it is combined with flavoring and coloring substances the buyer will accept it as a beverage, it still contains quantities of the poisonous denaturants. This class of liquor is found to constitute a large portion of the illicit supply, and accounts in a large measure for the alarming number of deaths from poison liquor.

There are two classes of denatured alcohols, for the regulation of the use of which seventy-six formulas have been evolved. The first class is known as completely denatured alcohol and is prepared according to seven special formulas for sale to the general public without permit. This denatured alcohol, which is rendered utterly unfit to be taken internally in any form, constitutes the bulk of the denatured alcohol used in industry. It is used commercially in alcohol lamps, toy engines and various heating and lighting devices, automobile radiators, and in the manufacture of formaldehyde and various dyes. Some of the denaturants used are wood alcohol, benzol, pyridine, kerosene, ether, nitrobenzol, pine oil and aniline. Wood alcohol, the most commonly used, is an exceedingly poisonous denaturant, and being practically odorless and colorless its presence in any intoxicating liquor could not be detected by the sense of sight, taste or smell. Any quick test such as the addition of powders or vials of liquid for the purpose of determining the presence or absence of wood alcohol is practically useless, Dr. Doran said, detection being possible only through chemical analysis by a skilled chemist in a well-equipped laboratory. It intoxicates the consumer rapidly, and, in addition, seriously affects the optic nerve, causing paralysis and atrophy with consequent total blindness which, as far as is known, is incurable, inflammation of the kidneys and bladder, nephritis and cystitis, and frequently death. Death has been caused by as little as three ounces, it is recorded.



DR. J. M. DORAN,

Head of the Industrial Alcohol and Chemical Division of the Prohibition Unit.

The second class, known as specially denatured alcohol, is prepared by the use of hundreds of specific denaturants, according to seventy different formulas. It is not so thoroughly denatured and protected as to permit its general sale without permit, and can be obtained only under a heavy bond for use in manufacturing processes, such as in the manufacture of toilet preparations, rubbing compounds, and many industrial products. Although not so thoroughly denatured, the formulas are so constituted as to prevent the use of the product internally, although the redistillation of rubbing compounds is one of the grave problems with which prohibition officials have to deal.

"It will be readily seen that much of the whisky and kindred drinks peddled by bootleggers have as their basis either the filthy moonshine with its attendant poison, or one of the two classes of denatured alcohol, all of which are absolutely dangerous to health and life," said Dr. Doran.

"The only source of good liquor is that illegally withdrawn from bonded warehouses, and that which is smuggled in. Even these very rarely reach the consumer in their original state, for no bootlegger is going to overlook the chance of making large profits by selling good liquor, when he can dilute it with redistilled denatured alcohol, wood alcohol, filthy moonshine, add a little coloring and flavoring, and make four or five times the original amount."

Every precaution has been exercised to prevent illegal withdrawals of liquor from bonded warehouses, in which effort the Federal permit system has been very effective. Prior to prohibition there was an approximate annual consumption of 130,000,000 gallons of whisky in the United States. In 1920—the first year of the operation of the Volstead Act—there were liberated ostensibly for medicinal purposes 12,500,000 gallons of whisky, while in 1921, through the new methods of control and regulations, withdrawals were reduced to 3,500,000 gallons; in 1922, to 1,800,000 gallons; in 1923, to 1,754,893 gallons; while withdrawals from July 1, 1923, to March 31, 1924, indicate that the total for 1924 fiscal year will be about the same as for 1923.

A Federal permit is required to withdraw liquor from bonded warehouses, and to prevent counterfeit permits being used they are printed from an engraved plate on especially designed sensitized paper, by the Government Bureau of Engraving and Printing at Washington. These are issued to Federal prohibition directors in each state upon requisition, who, for further protection, employ an ingenious machine, resembling a check-writer, by which an impress is made on each withdrawal permit showing the amount of liquor authorized to be withdrawn. This machine is designed to prevent the raising of withdrawal permits after issuance, which was not uncommon in the past. In addition, permits to purchase covering interstate shipments of intoxicating liquor, including alcohol, must be countersigned by the prohibition director of the state in which the distillery or warehouse is located, thus furnishing a director full knowledge of all liquor transactions within his state.

The papers are full of stories to the effect that thousands of cases of liquor are being smuggled into the United States every month. These are branded as utterly false and absurd by Federal Prohibition Commissioner R. A. Haynes. "It is impossible," he says, "to obtain official figures on the amount of liquor that is being smuggled into this country, for if it were possible to check up accurately on the number of cases smuggled in, the government would know where, when and by whom it was being smuggled and it would immediately be stopped. The amount is and has been very greatly exaggerated. Such stories are of value to no one but the bootlegger, who relies almost solely on this method of advertising. Such reports are invariably followed by other stories of deaths from liquor poisoning, a gullible public immediately taking it for granted that it is getting genuine liquor right off the boat, although the bootlegger may have made it the night before in a shed behind his house out of filthy moonshine, redistilled denatured alcohol, and other ingredients. It is not denied that liquor is being smuggled in along our borders, bounded as we are by Canada on the north, Mexico on the south, and on the east and west by coasts which by their very natures provide excellent opportunity for the bootlegger to ply his trade, but there is nothing to be gained by exaggerating.

"In my opinion the bootleg business is in a fair way to solve the problem which it itself has created. It is not only threatening to take its own life, but it is inflicting upon itself serious injury which is bound to sap its strength and go a long way toward suicide. It is taking rope enough to hang itself—it is making poison with which it will effect its own destruction. No moral suasion exerted to deter men from drinking the stuff, no preachments on temperance, no arguments against excess, no pleadings of moral and religious impulsion will have as salutary effect as the authenticated, generally distributed facts regarding poison liquor."

That the people are gradually becoming cognizant of the danger which lurks in the drinking of bootleg liquor is revealed by the filing by a certain Building Trades Council of a petition prohibiting the carrying of liquor of any kind into meetings or on the premises of the plaintiff's property, it being alleged that great misfortune and suffering have been caused by death or disability of many of the workmen who are engaged in hazardous duties, due to the influence of vile and poisonous liquors "masquerading under the name of whisky." A larger number than usual of death and sick benefits have been paid, it is claimed, threatening to deplete the funds of the labor unions.

So alarming has the manufacture and sale of poisonous liquor become that several states have adopted legislation making the sale, giving away, or furnishing of any liquor for beverage purposes, upon the drinking of which death results, murder. Among the states adopting such legislation are Ohio, Oklahoma, Tennessee, Minnesota, Missouri, Rhode Island, and Virginia.

The poison bootleg question is one over which the public should be greatly concerned. You can't shut your eyes to the fact that there is scarcely a drop of liquor being bootlegged in this country today that is fit to drink. Even exorbitant prices paid by wealthy drinkers bring them nothing but poison. Bootleggers claim it is real stuff but chemical analysis and death certificates prove it isn't.

William V. Linder, chemist in charge of the Washington laboratory, with samples of seized liquors, ranging from "real stuff" to the vilest of concoctions. Only one out of a hundred samples is found to be genuine liquor.

Left—A display of counterfeit labels, liquors, strip stamps, et cetera, captured by prohibition agents in Michigan. Every label tells a story, and every bottle and container harbors the elements of untold trouble.

Blindness, insanity and death walk in the wake of the cup that cheers, and for a momentary thrill men flirt with death and darkness, paying stupendous prices for that which may destroy.

The Worst Bureaucratic Tendency of All

Concluded from page 6

quate family income has upon the infant mortality rate."

While the bureau has not positively advocated an economic readjustment whereby the government would guarantee adequate incomes for all families, many of its conclusions imply that such, or something similar, is desirable.

In urging the adoption of Federal laws regulating child labor, Miss Grace Abbott, present chief of the bureau, said in a Congressional hearing:

"When you undertake to get rid of child labor, then you must make some provision for the care of those children."

This implies government maintenance, which in the end would mean the nationalization of childhood.

Miss Florence Kelley, probably the ablest leader in the movement which revolves around the Children's Bureau, has said:

"It is unsafe to leave children to the tender mercies of the pressure of ignorant parents."

Miss Alice Paul, leader of the Woman's Party which represents the ultra-feminists, was quoted in a Washington newspaper a few years ago as saying:

"We intend to insist also that the state assume entire responsibility for the maintenance and education of children until they become of age."

While she was chief of the Children's Bureau, Miss Julia Lathrop went to Europe to advise the new government of Czecho-Slovakia in the matter of child welfare. In the subsequent report of the Children's Bureau some of the recommendations she made are repeated. They begin with the following statement of principle:

"The government through the ministry is responsible for the welfare of the children of the Republic."

Among her recommendations were the following:

That all new philanthropic associations and institutions for children be subject to licenses issued by the government.

That a staff of inspectors be maintained for reporting on the conduct of such associations and institutions.

That the government allow subventions to those it approved.

That for these there be formulated by-laws as to standards of child welfare to be maintained.

That the Children's Bureau, under the Ministry of Public Welfare, be permitted to take over and carry on the work of any found to be unsatisfactory.

In 1919 there was held under the auspices of the United States Children's Bureau a more or less international conference (persons from several other countries took part in it) on standards of child welfare. The proceedings later were circulated by the bureau as Children's Bureau Publication No. 60.

In them was a recommendation that the laws require all expectant mothers to register their condition to the health authorities, so that, among other beneficences, they could certainly be reached directly by the Children's Bureau.

In another bureau publication, the statement is made that,

"The most comprehensive study of maternity benefits and insurance which has yet appeared in any language is the volume by Madame A. Kollontai, 'Society and Motherhood.'"

Madame Kollontai was the first commissar of public welfare in the Soviet government of Russia and lately has been Soviet minister to Norway. Among several other claims to distinction, among them a book in which she violently attacked the institution of marriage, Madame Kollontai is credited with having had eight husbands.

When the Children's Bureau Bill was before the Senate in 1912, Senator Borah, its sponsor there, said, in reply to statements that its establishment would be followed by demands for more far-reaching Federal legislation:

"We will leave it to the states to enact the law, because the Federal Government of the United States has so arranged that it must be done by the states, and we are perfectly content that it shall be done by the states."

In reply to this, Senator Heyburn, who then was Senator Borah's colleague, stated that he had written to many of the leaders who had urged him to support the measure.

"I asked them what their object was . . . . Their answer, if not in uniform speech, in spirit is," he said, "that they hope to be in position to exercise jurisdiction over children who in their judgment are not being properly cared for. They want to become substitutes for parents. They are anxious to secure opportunity of becoming parents in fact of other people's children."

Speaking of the laws that later would be demanded, the Senator added:

"That kind of law would have taken Abraham Lincoln from his parents' care and custody and have had him educated by these theorists and interferers with the domestic economy and system of mankind."

Virtually that kind of operation is threatened or envisaged in measures which have sprouted from the tiny seed planted fourteen years ago in the form of the Children's Bureau.

Moreover, these measures presume that the states, local communities and parents cannot be trusted with the protection and care of children, no matter how much information may be supplied them by the Federal Government and otherwise.

Of one of them, Bishop Warren A. Candler, of the Methodist Church, South, has said:

"It proceeds on the absurd assumption that Congress will be more tenderly concerned for children than their own parents, and that from the distant Capital Congressional tenderness and wisdom will do better for them than their affectionate fathers and mothers, watching over them in their homes. This assumption appraises Congressional government far above its worth *and puts home government far below its value.*"

Congress, however, only would legislate; *administration would be in the hands of bureaus operated by or governed from the outside by coteries dominated in large part by extremists;* bureaus that invariably stretch their powers to the limit and, by reason of propaganda facilities at their command, would be almost beyond disestablishment.

Away Down South With Harris Dickson

Concluded from page 3

adventures of "Sunlover Sam," as another instance, not to mention the exploits of "Baltimore Criddle". . . . And the locale of his writings is everywhere in the South—cotton plantations, plantation "big houses," cane fields, steamboats—wherever Negroes are employed.

"I have been sufficiently interested in Negroes to read everything about them that I could find to read, and I know all types of them by personal contact. I've been among them in Africa. And it roiles me when somebody from the North comes down here and tells me that I know nothing about them," he said.

"Just now the Negro is attracting a lot of attention in the United States," the Judge continued, "but nobody knows what is going to happen to him. Race problems have been solved in three different ways, history says. One is suppression; one is amalgamation, and the third is annihilation, deliberately done. But we cannot conceive of any of these things happening now. The high-class Southerner least of all wouldn't conceive of anything like deliberate annihilation, for a reason outside of morality. He doesn't want to harm the Negro. Although he never owned slaves, the high-class Southerner is a residuary legatee of the patriarchal system, and he looks out for Negroes. He feels responsibility for them.

"But there are two classes of people who never will try to understand the Negro question, because they brush aside every fact which tends to upset a prejudice. One of these classes condemns all Negroes indiscriminately for the crimes of a few, and derides the idea that a black man may possess a single good quality.

"These partisans," and here the Judge became serious indeed, "point to the Negro who commits the unspeakable crime in the South; the Negro crapshooter and vagrant, the yellow nuisance on street cars, for instance, in many northern cities, as if they were the only Negroes in the world. Well, if you pin them down, these partisans will admit knowing good Negro carpenters and bricklayers, hard working draymen, farmers—hundreds of good Negroes of whom they are personally fond, and to whom they would do no injury. These antis are more noisy than numerous. A small class in the South, yet its activity creates a false impression of the whole southern attitude.

"And a considerable number of men are ready to adopt any course which would prevent the exceptional crime. When the sudden shock and horror is upon them, they do and say many things which would be impossible to conceive in calmer moments. But every man who has felt the terror of such a hideous crime can understand the circumstances under which he himself might become a blind and vengeful savage. These men go wrong in their extreme view as applied to all Negroes. By intemperate denunciation they alienate sympathy, and postpone a practical remedy.

"The other class is composed largely of pro-Negro visionaries. They have never rubbed elbows with a real Negro. They ignore his fixed hereditary instincts and insist on misfitting to him certain beautiful theories which have elevated the white race. These men imagine the Negro to be a white man unluckily born black, and attribute to him the same ideals, traditions and modes of thought as the Caucasian. Their theory is that with a few undiluted doses of book learning the Negro is capable of entering at once upon all those complicated rights and responsibilities to which the white man has been struggling upward for many ages. These men are wrong; just as wrong as the antis.

"The pro-Negro enthusiast, and the Negro-hater are running neck and neck to see which can do the black man the greater injury. It is difficult to determine who is more unjust—the man who says there is no good in any Negro, or the philanthropic man who boosts all Negroes into a false position where they cannot maintain themselves.

"To often in judging a Negro the Caucasian applies his own logic to certain external phenomena. He reaches a conclusion as to what these acts would mean, and where they would lead, had they been performed by white men. Therein he errs, for the black mind does not run in a white grove. A white man's logic does not apply to the black man's motives. But the white man must know, else he can never be just, either to the Negro or to his own kind. First of all, the Negro must be understood. Nobody knows the Negro, not even those people of the South who come in daily contact with him. To them he is a good-natured, irresponsible mystery.

"Negroes know the minutest details in the lives of better-class Southerners," the Judge continued, "because, servants change like drops in a flowing stream. There is little, if any, ante-bellum fidelity left. They swap information about white folks. They hear family conversations and race discussions, and learn the white man's point of view. The white man doesn't learn the Negro point of view. Negroes talk freely among themselves, but they shut up like clams if a white man comes around.

"People take the Negroes with whom they come in contact. If they're educated they get one view, the Negro as highly educated, apparently refined, and quite a capable man. But the system cannot be successfully followed. The Negro must be studied *en bloc*. The Negro question cannot be confined to a section, nor even to a country.

"There is also the matter of Negro health. It may be that the question will bury itself. The Negro is not the strong healthy man that he was. You will notice that in the good health of old Negroes you see. It is the result of regular lives in their youth. Drunkenness, cocaine, dissipation, immorality, are at work upon younger Negroes, social diseases are cutting down the birth rate. Tuberculosis is playing havoc—and yet not so long before war between the states, a doctor exhibited a Negro with consumption as a curiosity before a medical meeting in Cincinnati. The disease was rarely found then among the race. They were out-of-doors people. But the Negro will not take care of himself. He lives in the present. If it is nothing that will kill him today, why, he does nothing about it. Tomorrow is something else.

"But you asked me when you came if my stories are historically correct," said the Judge, when I was preparing to leave. "And what about the smell of fried catfish that permeates my Vicksburg stories?

"I have always had the ambition that years after I'm gone," he went on, "and people look back at that period of which I write, and want authentic data on it, they can turn to what I did, and they can see what people actually did, and thought, in those times. I never sacrifice the truth to gain dramatic effect.

"As for the catfish locale, and the characters," he said at the door, "you'll find the entire layout, if you just go down toward the river from Washington street, and follow the smell."

When you do this, you step into a queer maze. This-minute-jazz, for instance, rubs elbows with voodoo beliefs. No white man can hope to get head nor tail of it—he only can look at it . . . . Harris Dickson has a better idea of what it all means than any other man, because he came in contact with the life of the maze when he was on the bench. Then, too, he's the friend of these folk; he writes about them, and mingles with them.

They are an odd lot. The old woman, for instance, who never is without her "nation bag," which contains bits of lodestone, and what not—sure preventive of voodoo spells. Her greatest fear is that some evil one will catch her without the bag—and straightway change her into a monkey. Her fears keep her in constant hot water. If you stand upon her sidewalk, and sprinkle a pinch or two of cornmeal, or powder, anywhere between the curb and her front door, she attempts to rout out all the police in the city to put a stop to your voodooistic antics. The police do their best by her, but people are always doing this to torment the old woman.

But when your camera is open, and ready for business, you're alone. Old Negroes, sunning themselves, hobble for the obscurity of their homes at sight of you. They do not want their pictures taken. By way of illustration:

She stood, an aged Negress, upon the sidewalk, a "head handkerchief" adding to her picturesqueness, and with a pipe in her mouth. At sight of the camera, she turned and fled. She stood peering from her half-opened door, and was not to be persuaded into having her picture taken.

"Honey chile," she finally said, "White fo'ks up Nawth read dese nigger stories, an' dat's all right when dey don' see me, but if dey see me wif mah haid rag, an' mah pipe, an' they 'Whuf! Whuf! Whuf!'—laffin' at an ol' nigger ooman—honey baby, Ah jes' doan' want mah picture took."

The smell of frying catfish isn't always present in Negro restaurants, though the fish are favorite Negro food. At times, when the river is at flood stage, there's a scarcity of the fish.

"Then this hyah street, hit's stew street," explained the owner of a catfish stand. "They all goes to stews—an' when hit's hahd times, they do, too.

"Hit was hahd times last Christmas," she went on, "an' Ah cooked a big goose. Well, these niggers come in. an' they asked me to sell 'em a nickel's wuff of goose. They say a nigger won't faint, but Ah like to fainted then."

This Rancher Once Ran a Rattlesnake Store

Concluded from page 11

toward its victim. Like flies, rattlesnakes are viviparous and bring forth their young alive. The first button or rattle is present when the snake is born. Captive rattlesnakes at the age of sixteen months have been found to have six rattles. Subsequently, one or two rattles fall off each time the snake sheds its skin. They are easily injured or broken from the body. The rattles bear no relation whatsoever to the age of the snake.

An amateur hunter has recently perfected a novel puttee which is now the most effective leg armor against rattlers, aside from high leather boots. The interior of this legging is made up of a great number of aluminum links which cover the entire calf of the wearer up above the knee. The exterior of the puttee is heavy canvas. The rattler-armored leggings are light in weight and cool to wear. The writer threw a sharp knife at the leg of the man who was wearing these protective puttees. The knife point struck the armor and bounded back five feet in the direction from which it had come.

A Texas farmer had a crop of valuable wheat on some cutover land which was infested by rattlers. He was afraid to cut the wheat by hand for fear of poisonous snake bites. The stumps prohibited the use of machinery. A professional hunter and trapper chanced to pass that way, heard of the grain grower's predicament and offered his assistance. The farmer gave the hunter the job of clearing the field of rattlers. Around his legs from ankle to thigh, the hunter wrapped the skins of sheep that had not been sheared before being killed. Then armed with two large and razor-edged knives, he entered the grain field. When the rattlers would strike at his legs, their fangs would catch in the dense woollen leggings. It was then easy for him to kill the poisonous snakes with the knives. In a few days, he had cleared the field of rattlesnakes and the farmer was able to save all his seed wheat crop.

Canary Birds Are "Undesirable Immigrants" If They Don't Sing

By S. R. WINTERS

IF YOU own a canary or are contemplating the purchase of one of these song birds, it is of interest to know that during this last fiscal year 182,000 canaries were imported into the United States. This represents an increase of approximately 28,500 more than the number shipped into this country during the previous fiscal year.

Of greater significance than mere numbers is the manner of transporting these song birds and how the Biological Survey of the United States Department of Agriculture makes certain that only real singers have their "immigration papers" approved. Canaries, for the most part, are imported from Bremen, Germany, where they are assembled after having been raised by peasants in the Harz Mountains. These are famous for their song. Permits for as many as 17,000 canary birds in different consignments have been issued in one day, and single shipments of more than 3,000 canaries are not uncommon.

Selecting cage birds.

In the Harz Mountains, Germany, or other points where these birds are collected, each bird is placed by itself in a cage. These cages are arranged in tiers comprised of three cages one way and seven cages the other. Then the tiers are placed one above the other, in a crating five feet high secured by strips of wood and protected by canvas. This is the way these birds leave Bremen, Germany, for America, and during the journey across the Atlantic Ocean they are fed and watered daily.

Once the canaries have reached port, an inspector—a representative of the Biological Survey, in this instance—examines the shipment, having the crating taken apart to be positive that only canaries, and healthy ones at that, are being distributed in this country. Then, too, the inspector of the Bureau of Biological Survey of the United States Department of Agriculture determines whether or not each canary is true to its representation. That is to say, each cage is placed in a sunny window in the establishment of the importer and if the bird responds immediately by singing it is marked for sale. The birds that are silent when thus treated are reserved for a time until their singing tendencies are made known.

The Place of Sororities in College Life

Concluded from page 9

face the condescending graciousness of their fellow townspeople who have got in. Many others slip quietly into much the same groove that would have claimed them had they made the Promised Land. The really big ones among the relict set out to be somebody in spite of the "Greeks." A few do this hoping for a belated bid but more do it because good, much-maligned pride has come to their rescue.

"It takes more real stuff to be somebody on the campus outside a frat than in one," was the way a senior put it to me the other day. He had been rushed and dropped as a freshman but by the time he was a junior he might, had he wished, have joined any fraternity on the campus.

"If you're in, your crowd backs you but if you're out you've got to go it alone. Gee, it almost knocked me out when I didn't make it. I'd figured so sure on dad's old crowd, you see. I wouldn't go back home but I was about all in when one day the prof gave us a little spiel about a quotation from Montaigne and the thing got to me somehow, by gad. This is all it was: 'A wise man loses nothing if he but save himself.' I knew after that that I could go it alone."

Possibly colleges like Vassar, Bryn Mawr and Chicago, where sororities do not exist, are fortunate and undoubtedly more democratic. A Vassar graduate, the young wife of a professor here at B———, said recently, "There is more real democracy to the square foot at my alma mater than there is on this whole campus." In truth at Vassar and Bryn Mawr and many other women's colleges where sororities are not found, wealth and social position of parents do not count in the social activities and the life of the college.

At great coeducational institutions like Cornell and Michigan the fine residence halls for women have introduced a new and wholesome element into the social life. Residence in these endowed halls is based upon scholarship and personality and admission is considered an honor. Prominent visitors are entertained frequently and these organizations are in intimate contact with the finest things a college affords. The cause of democracy among women in these universities has been greatly furthered by these large groups of superior women; selected on an absolutely democratic basis and recognized as independent groups in all university activities.

Some Modes of the Moment

Paris Couturiers and Mannequins Make a Supreme Effort to Cajole Americans to Buy

By LEONORA RAINES

PARIS, August—Again has the mountain been in travail, had a very "bad time," and—brought forth a mouse! In other words, Paris has put it over once more on an innocent and unsuspecting public by holding all sorts of conferences, employing all sorts of schemes to mystify, keeping women and men at bay while she was preparing her autumn styles. She needn't have gone to such trouble, for the few new ideas are not worth it. But goods are so lovely, the pictures the mannequins make as they float in and out of rooms so pretty, that only the experienced eye notes the same old fashions greeting her. Another case of old wine in new bottles.

The mannequin clad in the rich things does all she can to throw sand in the eyes of her employer's patrons, which just now are the American commissioners, since all Paris is on a vacation and no one left in the city, save those who cross the ocean to buy new clothes for their houses, wants to be reminded of winter things. The number of United States merchants runs high this year, but for some reason or other not as high as usual. For the next fortnight the establishments here will be occupied with orders for overseas, then the whole firm will relax and take a breath of air before the real autumn patrons return from villégiature (the country).

The *couturier* (ladies' tailor) has invested, all told, about $40,000 in his new layout. He generally gets this back from the foreign commissioners, then his autumn and winter trade makes his margin for him. Of the 250 models, at the end of another month, perhaps, the number will simmer down to seventy-five. All the dressmakers want to make a great blow-out, and if each did not have a dazzling number, then it would look like a lack of prosperity in the place. A large per cent of the dresses are no earthly good except to awaken the drowsy spectators and get them ready for what is coming.

Some Extremes in Style

THE parade this year is not unlike that of other years. Twice a day the mannequins are the center of attraction, and to one uninitiated in the psychology of reserved seaters, it would appear that many of the commissioners look more at mannequins than what the mannequins wear. And the young women would satisfy the eye of the average person, surely. In the old days, mannequins were chosen for height and grace. Now, most of them are petite. *Couturiers* know that their cuts are not for the dignified, sedate person, so they pick their builds in accordance with their styles.

There is not even a new wrinkle as to headdress. The "hair tower" used to be part of the show, but the dab of hair fashionable could not be anything but funny and childish. The late-lamented Margot used to be famous for the pile of hair on top of her head. It reached a foot above the brow and lay in a mass of gold waves, though everyone knew that both the waves and the gold were false. At present, and for some time to come, shorn and shaven heads are and will be *en règle* (in order).

In some cases the hair is cut so close and the front smoothed back so flat that we are reminded of a "scared cat." Geraldine Farrar was the one who introduced the plain, straight-back style, and now all Paris is mad over it. To those who can wear the *garçon* (boyish) effect and so do away with the once-considered "crown of glory," the shingle and severity are fascinating. In many cases, the small head, which is the smart head, goes well with the short, narrow, schoolgirl effect of the silhouette. The mannequin, of course, is sweet in the razored head, just as young things are sweet in almost any style, but I may state that an army of middle-aged women have adopted the shingle and it is very flattering.

The big houses—Drecoll, Worth, Martial and Armand, Patou, Doucet, Bernard, Callot—all show more or less the same ideas. Detail marks the only difference. All vie with each other in sumptuousness and richness, and after a spectator has visited, say, a dozen houses in a week, his head is reeling.

Really, of the houses mentioned and a dozen more, I see little difference in their wares. All are exclusive, beautiful, wonderful in coloring, simple to a fault, yet a simplicity that calls for a master hand. I think the very factor of no new ideas is in favor of the *couturier,* and speaks for his sincerity and good sense. Women like the styles that have prevailed the past year, so why should they change? A big change means a radical one, and with the expense of material, the public at large would balk at this.

Sometimes we are led to believe designers and *couturiers* are indifferent to or make fun of the public in the cuts they introduce. Such is not the case. The public wants a change, it cannot speak its mind, and the powers that be try to make suggestions. Often they fall down desperately, as we all know, but generally they are right. Incongruous as present-day dress is, it is only a reflection of the public mind. Women adore short skirts; they will have nothing else than loose blouses and corsetless lines; a wide skirt would be in their way; they like the air to waft about neck and arms. *Voilà!*

Since almost everyone is calling for abbreviated skirts, I have seen nothing else at openings. Skirts now escape the ground by twelve or fourteen inches, and in many cases play about the hollow of the knee. They are so narrow that an opening must come in the way of a slit at the side or back, or the opening must be made under a plait. The folding skirt gives room for the proverbial short step, for these days women do not walk. They mince and squint when they put one foot before another. When a woman gets in earnest, however, as she does when running for a car or to get out of the line of a motor, by instinct she pulls up the garment called skirt and away she goes, indifferent to what curious eyes may say.

The waistline is sane in most cases, but when there is a swathed belt it is well over the hips. These belts are often in soft red leather, or of metal, and come together in a motif which may be mother-of-pearl or enamel. The belt never interferes with the long line which looks as though it meant to stay with us, since every woman yearns to be tall, lean, and lank, and the elongated line helps things mightily. The queer idea is that while skirts are tube-like and skin-tight, from hips up the effect is loose and almost untidy.

Many of the evening frocks, which seem destined for the stage, are trimmed elaborately in ostrich feathers, in jeweled effects, such as bunches of *paillettes* (spangles) or iridescent pearls and beads. Long loops and pendants of white beads hang like a fringe, and one dress seen at the house of Bernard looked like a snow scene, in its spangles, bugles, and bead fringe over chiffon—all pure white. To relieve the white or delicate colors, a colored scarf is often used, and this same scarf idea is carried out in wraps, in street and afternoon dresses and frequently is the only trimming a dress shows.

Was there ever a *couturier* collection that did not exploit navy, black or brown? We see these everywhere. Black-and-white combinations are popular, but they are always in the autumn, and as for black, it is beloved in Paris in and out of season. This year black is seen in dresses, but not in coats. Last spring the best wraps were black, but no more. Prevailing dress tints are browns and reds—modifications of both. In the latter we have flame, ruby, fuschia, orchid, brick. In the former, there is a still wider range in buff, beige, chaudron, amber, and dense brown. The brown most popular is that known as *noisette* which is a soft, lovely tone, universally becoming.

As for materials, the soft, alluring, velvety ones are best in wool. The seductive duvetyne is still here, also its cousin *velour de pêche.* Cloth will again have followers. For afternoon and evening, the most *recherche* (sought after) is ottoman, not only the fine rep but the very coarse. *Couturiers* seem to favor the ottoman, and they are right, for it is wonderful in any dye and makes any robe rich and luxuriant. Crepe de chine, crepe Georgette, a few taffetas, these lead, with chiffon to trim. Much fur is put on everything, and is dyed salmon, red, pink, brown—indeed no shade escapes it.

A peculiarity in trimming noticeable in all large houses is a fine line running down in front or back—often nothing but a tiny cord of *soutache,* finishing at the waistline in an embroidered medallion or one in the jeweled medallions mentioned. Frequently, one side of a dress is quite unlike the other side. Gold metal has become a craze. It is made into laces, into pockets, into entire blouses. At Martial's and Armand's, at Drecoll's, at Callot's, in fact in various places, I saw blouses almost reaching to the hem of skirt in the gold metal, sometimes with no trimming save a dab of color.

Hats and Gloves

SURELY there is nothing to the present Paris hat, and whether it will stand the winter through is a problem. There is simply nothing to the little excuse of headgear, and yet women will have nothing else. Can it be that the sartorial world is lazy, tired of dressing up and pleasing the public? We all realize that a well-dressed woman is a hard-worked woman, and maybe the feminine portion of a community demands a vacation. Milliners in Paris wring their hands over it all when customers throw a big, trimmed hat in their faces, but nothing is to be done.

No veils, no plumes, no flowers, no nothing, save a silly little ribbon fastened across or around the crown. The bell shape is even smaller than it was months ago, and is falling farther over the eyes. The black is best, in soft felt, though surely when autumn really appears, shades of brown will be ordered. I go from milliner to milliner, and see absolutely nothing to write of, for everywhere are the tiny felt shapes with only a suggestion of trimming.

The jeweled craze has struck gloves, and I am shown gloves that are all gauntlet, the latter finished in coarse white embroidery with tassels, and I have noticed mother-of-pearl worked into the gauntlet. The black kid is the thing, embroidered in white or cream, or in black with colored threads.

As for shoes, America is the place for shoes—shoes and hose. Shoes in Paris look very pretty, but those not made in American factories here are rough on the feet. The best we see are *décolleté*—cut low across instep and ankle, in many cases nothing but glorified sandals. Only the narrow leather bands keep them on the feet. Black shoes and flesh-colored hose have been very *chic* all summer, but just now it is the bronze shoe with pink hose.

An International Congress of Mathematicians

By LOUIS C. KARPINSKI

THE popular idea that the college professor enjoys long vacations undisturbed by any work connected with his profession is a delusion. In fact, during the vacation period the scientists are largely making the most of the opportunity to advance the cause of learning.

Another type of professional activity is involved in the congresses and associations which meet during the vacation periods. The American Association for the Advancement of Science regularly meets during the Christmas holidays, and so do national societies of mathematicians, philologists, historians, and chemists. For international gatherings the summer is chosen, as it enables the participation of widely separated groups of scholars.

During the week August 11 to August 16 just past, an International Congress of Mathematicians met for the first time in America at Toronto. The name "international" was in this case slightly a misnomer, as Germans and Austrians were excluded. However, to the credit of the mathematicians, be it said that arrangements were concluded at the meeting to insure the participation of Germans and Austrians in the next congress, four years hence. Two great American universities declined to participate in this congress because of the exclusion. Mathematics and science are truly international and advance has been due to the co-operative efforts of Europeans and Americans, to Orientals and Occidentals, to intelligence without respect to clime or time.

Wide Field of Activities

THIS congress devoted particular attention to the engineering and practical application of mathematics, and was subdivided into sections whose designations are somewhat technical. The sections were:

1. Algebra, Theory of Numbers, Analysis
2. Geometry
3. (a) Mechanics, Mathematical Physics
    (b) Astronomy, Geophysics
4. (a) Electrical, and so forth, Engineering
    (b) Aeronautics, Naval Architecture, Ballistics, Radiotelegraphy
5. Statistics, Actuarial Science, Economics
6. History, Philosophy, Didactics

At a real mathematical conference when one man reads a paper, as a rule, out of fifty men present one or two really know what it is about. However, all look wise and await the printed paper to really examine carefully the contribution. During an international congress the situation is further complicated by the language problem. Practically all scientists read French and German but few Americans speak either with ease or understand the rapid-fire French of the native Frenchman. Occasionally one can see a distinguished mathematician taking a nap during some paper, quite as people do in church during a long sermon.

At the Toronto conference, in deference to the presence of engineers and physicists, more attention was paid to popular exposition. The theory of relativity occupied a prominent place on the program of the congress as well as of the British Association for the Advancement of Science which met simultaneously in Toronto. The application of mathematics to the development of naval architecture and to aeronautical problems was extensively discussed. From the mathematical standpoint the movements of a body in water or in the air are analogous problems In consequence, the theory of ship construction, of submarines and of airplanes have much in common. In fact, the problems of the projectile, the flight of a bullet, are also mathematically connected with the submarine and airplane. Real advance is now being made in all of these fields by the consideration of the equations and formulas involved in the movements of such bodies.

Similarly sound and light and electricity are fundamentally connected from the mathematical standpoint. One of the most striking papers of the conference was concerned with the aurora borealis. The author, Sturmer of Norway, began with certain simple (?) equations connected with a magnetic field. The results of the mathematical consideration demonstrated that with a given type of magnetic field strange lights would be concentrated in certain areas about the magnetic poles, corresponding to the northern lights. Then the experimental verification consisted in taking a magnetic globe and producing with it beautiful phenomena entirely similar to the northern lights. By observation stations in Northern Norway, the height of the northern lights was established as commonly about 100 kilometers (162 miles) above the earth's surface, rarely lower.

Insurance, economics and statistics were also the subject of extensive discussion in this mathematical congress. Strange to say the premium which one pays for a life insurance policy is the subject of most elaborate computations. More than that, one can truly say that the price of a street-car fare hinges on mathematical formulas. In modern industry replacement of machinery constitutes a major difficulty in estimating costs. It is perfectly evident that to take a ride on the street car it is not necessary for the passenger to pay for the car. Nor indeed must it be paid in one year. However, out of the humble nickel (Detroit, six cents) some money must be set aside to pay for a new street car after twenty or thirty years. Here the mathematician enters and tells how much money must be put aside each year to accumulate at compound interest to replace the car.

UNIV OF ILLINOIS URBANA ILL

BRIEFLY TOLD

Eight mountains in British Columbia have been discovered and ascended by a University of Chicago professor and a New York engineer. One of the peaks, yet unnamed, ranks among the highest in the Canadian Northwest.

A fifty-foot waterspout near the Statue of Liberty in New York Harbor traveled along from the south end of Governors Island to the north end, where it sheered off toward the United States Barge Office and broke up with a dull boom near Castle Williams. A steam lighter in the path of the waterspout lost the greater part of her deckload of lumber when the waterspout hit.

Canned whale meat has become an established commodity among the Negroes of the West Coast of Africa, where the entire 1923 pack of British Columbia was sold.

Beavers repaired a dam near Bellefonte, Pennsylvania, that was two hundred feet wide and from four to ten feet deep. Farmers and fishermen had considered repairing it but had been deterred because of the expense involved.

When the discontinuance of the Fox & Illinois Union Electric Railway threatened the prosperity of the farmers in Kendall and Grundy counties, Illinois, the farmers bought the railway at junk prices to market their produce.

In China the doctor receives his fee for keeping the patient well. When the patient gets sick, the physician's fees stop until the patient is on his feet again.

Herds of muskox are reported within a day's run of the north shore of Great Slave Lake.

It is believed that within a few years the northern part of Alberta will be stocked with an animal which is a cross breed between the buffalo and the domestic cow, these animals, upon which extensive experiments have already been made, proving well adapted to the northern winter.

On the top floor of the New York Cotton Exchange Building in the Cotton Board room is a large map of the United States on which current weather conditions are kept posted. News of storms, hot and cold spells and rainfall are marked on the map which influences the cotton trading.

Galvanized steel sheets are being used as barriers to stop the ravages of locusts in the agricultural regions of Argentina. The sheets are erected by farmers who dig ditches in front of the barriers, into which the marching locusts accumulate and are destroyed.

A grove of giant redwood trees in Kettintelbe, California, was dedicated to the memory of the late Franklin K. Lane, former Secretary of the Interior and an advocate of forest conservation.

The silk worm demands that the mulberry leaves on which it feeds shall contain the exact amount of moisture which its system requires, plus the amount which it disposes of through the pores of its skin. The leaf should contain about sixty-five per cent moisture.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The statue of George Rogers Clark, the cut of which appeared in our July 19 issue, was given to the University of Virginia, by an alumnus, Paul Goodloe McIntire.

Citizens of Australia who do not vote at federal elections must pay a ten-dollar fine for their negligence.

Because of the chestnut blight now prevalent throughout the country it is feared that within ten years the chestnuts will vanish from America. The United States Bureau of Foreign Plant Introduction is endeavoring to acclimate certain blight-resisting species of chestnut from China and Japan to replace our native trees.

In Sweden, before telephone poles are planted they are drilled longitudinally with a small center hole, and then the opening at the bottom is plugged. The hole runs to a point about one foot above ground. A small side hole is drilled aslant to meet the center hole and creosote oil is poured in the center hole every two or three years.

Certain kinds of flowers are affected by music. Where there is a steady volume of sound for long periods during the day certain sensitive blossoms develop a leaning tendency away from the direction from which the music comes.

The smallest fish in the world are the gobies of Lake Buhi in the Philippine Islands. They are only half an inch long when mature. They are eaten fried when freshly caught and pressed into cakes and dried when the market is overstocked.

Spider webs are used for the cross hairs on surveyors' telescopes. The web is taken from the insects by allowing them to drop from a loom. As they drop the web is wound on the spool and stored for future use.

Ts'ai-lun, a Chinese, made the first paper from the bark of a mulberry tree in A. D. 75.

No rain has fallen in Central Australia for a period of three years.

Imitation pearls are being made in America from fish scales.

Papyrus, the plant reed that more than two thousand years ago supplied the world with its principal writing materials, is again being used in the manufacture of paper. Mills are being built in Africa and the pith of the papyrus will be treated in somewhat the same manner as the modern wood pulp.

In talking over the telephone if one talks with the lips six inches from the transmitter it is equivalent to inserting another two hundred miles of line between the speaker and the listener.

The Maharajah of Alwar has replaced his royal coach with a modern luxurious automobile mounted on a chassis that has a wheel base of one hundred seventy-eight inches.

Experts in the United States Army have invented a method of vulcanizing rubber which makes it three times lighter than cork. Aviation life preserving suits are being made of this material, according to an article in *Popular Mechanics.*

Pythons and boa constrictors are purchased by the yard by museums.

Oxford and Cambridge universities are embarrassed by the great number of wealthy young Americans who are applying for admission in October. For the most part these young graduates are sons of wealthy parents who desire to spend a few months in Europe and have no serious intentions of studying. However, these universities welcome gladly those Americans who wish to follow the regular degree courses and who will study hard to win their degrees.

When a United States District Attorney came out of a New York City judge's chambers recently a woman seized him by the arm, saying, "Now, come along with me and get your flag and a copy of the Constitution." The woman was connected with some Americanization organization and had been sent to court to help along the work of making new citizens good citizens.

Government pigeons are being taught to fly at night. Flocks of these birds find their way home to their electrically lighted loft on the darkest night as speedily as in the daytime. Ships and aircraft are being equipped with pigeons.

A group of Armenians plan to erect a funicular railway up the slopes of Mount Ararat, the mighty snow-clad summit of which at an altitude of 17,055 feet marks the dividing line between Armenia, Turkey and Persia. They plan to make it a sort of "Pike's Peak" pleasure resort and will charge a small fee for making the ascent to the summit from which an excellent view can be had of the entire Caucasus region.

"No man can produce great things unless he is thoroughly sincere in dealing with himself."—*Lowell.*

A motorcycle engine in a glider traveled ninety miles without a mishap in England.

CHRONICLER OF THE NEGLECTED TRUTH

Viewing Germany Under a Microscope

Unbiased Discussion of the Financial Situation for the "Fed-Up" Public; How the Mark Was Headed Down and Where It Finally Landed

By WALTER M. WOLFF

BERLIN, July 23—So much has been said and written during the last few years about post-war Germany, and so little real explanation has been offered concerning her problems, her people, and her thoughts about herself and others, that the people of the United States are justifiably tired of the whole business

"What really is true and what is not concerning German problems?" they ask. "What actually is the matter with Germany or is there anything the matter with her?"

The American people have indeed been told a great many things about Germany. Very few of the multitude of statements have emanated from German spokesmen. France has repeatedly told us what Germany is and is not supposed to do. England has tried to tell us what is wrong with the Teutons and what should be done to remedy matters. Innumerable American and foreign correspondents have told us that this, that, or the other thing is right or wrong but strange as it may seem, these individuals rarely agree on any particular point in their statements concerning German problems. Hence the nonplussed attitude manifested throughout the United States by Mr. Average Reader.

The Dawes Plan

THE biggest and perhaps the most popular of the world's politico-economic attractions of the present day is the Dawes Plan. On one particular concerning it we may consider the atmosphere as clarified. Germany has accepted the Dawes Plan and has signified her intentions of carrying out as far as possible its many stipulations.

But does Germany *favor* the Dawes Plan?

Would she have accepted it had there been some other alternative?

No. Germany accepted the Dawes program because it offered a way out of the hopeless economic muddle into which she had got herself. In the eyes of Germany, the Dawes Plan is nothing more nor less than a sugar-coated quinine pill.

Ambassador Houghton has likened the plan to a new suit of clothes containing some excellent material but requiring many alterations before it will fit the customer.

Dr. Marx compares the new program unfavorably to the Treaty of Versailles in many respects. Official Germany is inclined to regard the refusal to allow the German delegates to take part in the entire negotiations as a return to Versailles methods.

It was easy enough for the German Reichstag to vote acceptance of the plan after considerable preliminary argument and harangue. The real fun will begin when the Reichstag begins to pass the necessary laws that shall put the new program into effect. The German Communists, who are the majority of the working class, are absolutely opposed to it because they foresee that the burden of the taxes and obligations which are placed upon Germany under the Dawes Plan will fall principally on their backs.

The Nationalists of the Reich, who compose to a large extent the manufacturers, industrial barons, and landowners, are morally opposed to it because they see in its stipulations the complete "fleecing" of their country by the foreign powers—hair, skin, and all. The industrialists, of course, are also materially against the plan because they already see the clear road of financial burdens leading directly into their own personal pockets.

One of the most interesting and perplexing problems of recent years—one which has never been clearly explained to the American people and which is still a veritable mystery to the world at large—is the gigantic German inflation graft. Every American citizen, no doubt, has been sufficiently well informed by this time concerning Germany's "financial embarrassment"—her lack of working capital.

"A Fraudulent Bankrupt"

GERMAN business men are combing the globe for funds with which to stave off, as they allege, sheer bankruptcy.

Well and good, *but who profited scarcely a year ago by the unparalleled game played with Germany's money?* Somebody certainly did. Money itself is, of course, not wealth in the true sense, but the extraordinary manipulation of it has resulted in a transference of wealth—*to somebody.*

Are the Germans really rich or are they poor and who are these "rich" Germans we so often read and hear about, who can afford to splurge in foreign climes while the world is led to believe most Germans are poor as the familiar church mice? Were the German industrialists to blame? And were the profiteers German in race or heart?

Dr. Marx says, "Our industrialists are German, love Germany, and serve Germany *according to their light.* What motive or interest could they have in dishonoring her; in despoiling her; in spreading misery and desperation among her people? They have their ideas about government and policy, as have the rest of us. But they are not seditionists and they are not trying to establish an industrial tyranny."

The good doctor, bless his heart, must not be taken too seriously in these matters. He undoubtedly has good intentions and it is not easy to be German chancellor or head spokesman in these "poverty-stricken" days. But quite unintentionally, perhaps, he speaks the absolute truth in his first sentence. The German industrialists certainly served Germany "according to *their* light" during the inflation period! And a most delightful period it was, to be sure. Too bad it couldn't last indefinitely.

The great German inflation mystery will now be unraveled and the causes and effects of the big swindle will be fully explained and discussed. Meanwhile, Germany is looking for some "kind friend" with considerable ready cash who may condescend to part with some of the latter so that she (Germany) may keep going, commercially. If several kind friends apply—why, the more the merrier! Her position is much like the man who wills his "earthly property" to his wife and who then goes around, hat in hand and with pockets empty, seeking loans from the would-be good Samaritans of the world. The chief difficulty just now seems to be the incredible lack all over the world of "good" Samaritans.

Without stretching the elastic band of truth to the snapping point, we may make the following definite statement:

"Guilty of depreciation of currency by means of inflation and guilty of repudiation, Germany actually stands before the world a fraudulent bankrupt after having perpetrated the greatest swindle in the history of man and money."

The blowing up of the German mark and the unparalleled manipulation of wealth in Germany during the inflation period is not new to the American people. They know something was "pulled over" that smacked very much of the almost unbelievable—the impossible. What they do not know sufficiently and what they would really like to know is: How was this alleged enormous wealth created in Germany with an ever-depreciating medium of exchange? *Who really profited?*

Those Responsible

IN ANSWERING directly the question, "Who profited?" we may say, frankly, the fraud was engineered by certain officials, industrialists, bankers, and politicians in Germany, and through the dishonesty they have practiced since the revolution in 1918 they have enriched themselves and a horde of speculators and profiteers by wholesale defrauding of governments and individuals. The German industrialists, therefore, together with the bankers, politicians, public officials, and other equally guilty culprits, are directly responsible for stripping the German people of the last few pennies still in their possession after the defeat of war.

It is truly remarkable how little of the real story of the inflation-repudiation swindle gets beyond the borders of the German Reich. German bankers, industrialists, officials, and so on, vehemently deny all guilt in bringing on the depreciation of the mark. They protest vigorously against having derived enormous profits from the inflation of the national currency. The knaves, on the contrary, actually believe they have been grossly wronged because they were accused by the German people at large of being on par with criminals. The people of Germany's middle class, especially, although today too poor and too weak to make their grievances heard much above a faint whisper, feverishly point the finger of accusation at one and the same clique—Jews and Gentiles alike: the human bloodsuckers of Germany, the selfsame crowd of industrialists, political leaders, and others to whom we have made reference before.

But Chancellor Marx, sincere, philosophically inclined statesman that he may be otherwise, says to the world at large:

"Our industrialists are German, love Germany, and serve Germany *according to their light . . . .*"

"Ha!" thinks the German profiteer, "I've gone and done something pretty clever now, and nobody really knows how I did it. Well, of course, I'm "flat" now . . . ., outside of my estate, my automobiles, my factory equipment, my dollar account in America, my franc account in Switzerland, and so on, but I presume the less said about the latter, the better."

Spilling the Beans

SOMEHOW, however, the foreign newspapers spilled the worthy gentlemen's beans by very impolitely publishing such "shocking" reports as: "The waves of Teutonic tourists which have spread over France, Spain, and Italy in recent months have now begun to touch the shores of England . . . . With the Rentenmark worth more than a shilling it is no surprise to Londoners to see the visitors from beyond the Rhine lifting their glasses of champagne in the most expensive night clubs, tripping the light fantastic in the ballrooms of the big hotels or having their ample anatomies measured in the famous tailoring establishments along Savile Row and Sackville street, where German customers have been few and far between since the early summer of 1914."

But how do they do it? Where do they get the "necessary wherewith"? That is the question. Now for the answer.

Back in 1920, when the inflation period in Germany first began to assume importance and the German mark slowly but surely slipped an additional cog from day to day, the "wise Alecs" among the German business interests immediately began to desert the paper mark and to determine their prices on a stable basis. They clung to the old gold mark as a standard of value or basis of computation and adjusted their prices accordingly. In other words, they were careful never to lose sight of the "gold" value of their merchandise, despite the fluctuations of the paper currency or the inflated value of their goods in terms of paper marks.

At the outset of the inflation period, the "wise ones" referred to above were the exception rather than the rule, but their ranks soon swelled to enormous proportions, chiefly among the well-informed, major business and financial circles who at all times keep in close touch with the government and so influence the latter that they are always sure of receiving special dispensation and consideration. But to continue.

Where the Mark Went

WHILE the German mark was heading down the incline, the German merchant, particularly the exporter and manufacturer, was very careful to take payments for his wares *only* in foreign currency—dollars preferred, but English pounds, Dutch gulden, lire, and francs acceptable. The time finally came, as the world at large knows, when a dollar in Germany would buy almost anything the heart desired. The small merchants of the country and the people themselves, unschooled in sound business ethics as well as in financial trickery, were remarkably slow in waking up to the true situation—the fact that their old marks had lost all semblance of their former prestige and value and were doomed to certain disaster.

Even when German marks were still being quoted at 1,000 for a dollar, the average German confidently believed that "now then, it *can't* go any farther!" The consensus of opinion among the German people was that the high-water mark had certainly been reached and soon the recession would begin and their venerable "Reichsmark" would be deflated back to normalcy once more. But German "Big Finance"? Get the mark back to normalcy, did we say? Nothing was farther remote from the minds of the "wise ones" than just this. Not while they saw in the further depreciation of the national currency the opportunity of milking some real cream!

The mark continued to slip and slide—nay, it literally drowned itself, and our friends, the Preferred Class, soon basked in the warm sunshine of prosperity and a fountain of wealth gushed forth refreshingly right under their noses. But what did they do with this easily got gain? A goodly part of it went immediately into new buildings, canals, ships, electric and steam lines, mansions, factories, industrial equipment of every sort, and so forth, with the result that German industry today is, materially, second to none in the world.

The building trade was, of course, at a standstill in Germany during the inflation period, but one can easily understand how the German profiteer, the world market at his feet due to matchless prices and real money flowing into his coffers all the while, could afford to set up expensive edifices faster than pup tents in spite of all. Boiled down to the brine, the get-rich-quick plan in Teutonia worked something like this:

"Getting Wise"

WE WILL say, for example, a German exporter suddenly finds himself doing an enormous business; he has orders enough in advance to last him for the next twelve or twenty-four months. He decides to quote his prices only in terms of *stable* marks reconverted into the prevailing official quotation, at the time of a particular transaction, for paper marks. Of course, he is very careful to take final payment only in foreign currency inasmuch as he is given to understand that he must pay for his raw products with actual, "hard" money also. If the "Ausland" refused to take depreciating German marks, well and good; he would give and take—foreign currency, to the complete satisfaction of both parties concerned.

Finally, the German people, too, began to "get wise" and they bought foreign exchange whenever they could, as well as investing a considerable portion of their savings on the stock market. German manufacturers soon found they could secure capital almost at will; money began to flow on the stock market like water in the river and the German commercial world rejoiced in the sudden boom. The paper mark, however, remained the legal tender of the country much to the sorrow and disadvantage of the great multitude of the German people who were not "in" on the fat end of the nation's purse. German industrialists took advantage of the situation and paid their employes in paper marks, *being very careful not to pay too much*: that is, advancing very slowly with wage increases although the purchasing power of the mark decreased rapidly.

As time wore on, the German "Preferred Class" found they needed more and more capital; their appetite for profits grew almost insatiable. The necessary funds were by no means lacking. By rewatering his stock at frequent intervals, the German industrialist had already received credit to overflowing; now the Reichsbank came to his aid and what happened then will be explained in a concluding article.

Looking Beyond the Veil in Spiritland

How Materializing "Mediums" Bamboozle Their Credulous Clients

By JOHN SLOAN

SOME rather ironical philosopher, I think his name was Voltaire, has said that the supernatural is merely the natural that men do not understand. A large and growing number of persons who live by their wits have capitalized this lack of understanding on the part of the majority of the people of the world, shrouded their schemes in mystery, and are daily mulcting the public of thousands of dollars, giving nothing except baseless hopes and worthless promises in return. These swindlers in the supernatural are the horde of mediums, clairvoyants, palmists, crystal gazers, and fortune tellers of a dozen varieties who infest our cities, keep our police busy with their trickery, and, not infrequently, furnish the traps by which wealthy men and women are lured into the hands of confidence men and other sharpers.

There are, according to the best figures obtainable in 1924, approximately 120.000 of these dealers in mystery in the United States. That is to say that, for every thousand of population in this country, there is at least one person claiming in some form or another to be able to reveal the secrets of worlds other than this to mortal men. It is further estimated that each one of these 120.000 is making a living—that is to say, at least $1.000 a year—from the people of the United States. This means that Americans are paying a minimum of $120,000,000 annually for nothing. In all probability, according to figures supplied to the writer by a number of police departments, welfare organizations, psychological societies, and so on, the actual sum is twice or three times this amount.

On the opposite side of the ledger it may be stated as a fact that the only thing we know about the spirit world is that we *KNOW* nothing about it. We may *think*, and *believe*, and have all the *faith* in the world, but when all the evidence has been analyzed, the most intelligent, the best-trained, and the most accurate students of spiritual affairs admit that they *know* nothing. Of all the persons —usually called "mediums"—who claim to have knowledge of the spiritual or the supernatural, or who have delivered messages from the spiritual world to the physical world in which we live, there is not one who at some time or another has not been caught in fraud. The discovery of dishonesty in one action of a person pretending to have received and transmitted communications from the spirit world, opens all the actions of such a person to the suspicion of fraud, with the general result that all such communications or messages are today under a cloud of deception, due to previous instances of dishonesty on the part of the mediums receiving them, and are of doubtful value.

One of the greatest "magicians," or conjurers of modern times, who is now touring the United States, has had deposited with one of the largest banks of New York City for more than ten years the sum of $1,000, gold, to be given to the clairvoyant, medium, crystal gazer, or other worker in the supernatural, who can do anything by supernatural or spiritual aid, so called, which the conjurer cannot duplicate by material means. The only condition attached to this offer is that the conjurer shall be allowed to see the medium make the materialization, or do whatever other act that medium selects as a test, in such light and under such conditions as the medium may dictate; and that, after the medium has completed his or her demonstration, the conjurer be allowed to duplicate the materialization or whatever the work may be, first under the same conditions, and then again in broad daylight. The object of the daylight provision is, of course, the complete exposure of the medium.

In all the decade that this offer has been standing—and the writer knows that it is bona fide—not one medium or clairvoyant ever has come forward to attempt to win the prize. The writer has seen this magician duplicate, in the dark or in subdued light, the materializations, the table tappings, the slate writings, the spirit pictures, produced by one of the most widely known mediums in this country. Immediately after duplicating these supposedly supernatural productions of this medium, in the dark, the conjurer turned up the lights, and did all the work over again in the light, exposing trick by trick as mere legerdemain, not all of it so clever as the work of the average sleight-of-hand performer behind the footlights.

The deceptions by which the American people are looted of millions of dollars every year by these tricksters may be divided, roughly, into four classes: Fortune telling, including palmistry and crystal gazing; slate writing, and communications from the spirit world through the mouth of a trance-medium; reading and answering of sealed letters written by the gullible; and the materialization from the spirit world of men, women and children who have passed out of this world.

Above—Faked photography as an aid to spiritualistic jugglery. Below—Two exponents of the cult of the supernatural who came in conflict with the law. Left—Madam May Eberwein; right—Madam M. A. Hendrickson.

Though their fees are the lowest, it is probable that the fortune tellers get the lion's share of the money paid for this chicanery by the people of the United States. It is one of the wise provisions of Nature, God, Destiny, or whatever we may wish to call that power which rules the Universe, that no man knows his own future. The desire to know something which no one else knows prompts men and women to pay their money to be deceived by tricksters who claim to be able to tell what lies beyond the curtain of tomorrow. Playing cards, palm reading, and crystal gazing are the three most popular means of "searching the future." Obviously, the fixed figures of a deck of playing cards can know nothing of the past and less of the future, unless it be when properly played in a poker game. Yet for hundreds of years men and women have believed in the augury of the cards, handled and "read" by persons of such apparent ignorance that their advice would not be taken except on the authority of the turn of a card, whose face neither the fortune teller, nor the one whose fortune is being told, could see. This method of separating the public from its money is rapidly going out, except in the foreign quarters of our large cities.

Palmistry is based on the position, depth, length, and configuration of the lines in the palm of the hand, and on the size and shape of the so-called "mountains" between these lines, and the raised portions of the fingers between the joints. Monkeys have similar lines and raised areas in their paws, and the future of a monkey can be as accurately foretold from his paw as from the hand of a human being. The real purpose of the lines in the hand is to increase the sense of touch by making little valleys and ridges which enlarge the area of the surface of the palm, thereby augmenting the amount of skin, filled with tiny nerve terminals, which comes in contact with anything the hand touches. By going in different directions, these lines help us to feel the character of the surface of anything that we touch. The delicate termini of the tactual nerves are placed to the greatest advantage in the so-called "mounts" of Venus, Jupiter, Mercury, and so on. Since even Omnipotence never has been able to make two mountains without a valley between them, Nature found it necessary to make the creases in the palm which the palmists call the "head, heart and life lines." These lines also assist in the folding of the skin when the hand grasps an object.

The writer recently discovered that by careful working with an ivory paper-cutter, he could deepen, lengthen and broaden the lines in the palm of his hand, and that by gentle massage, he could raise the mountains on that hand considerably above their normal level. This seemed like altering the future, or changing predestination, or trifling with fate, or something unnatural in the supernatural like that, so, clasping a silver dollar in my left hand, I went to a celebrated palmist, offering her the hand and the dollar. I received in return an elaborate future, involving an approaching marriage—to which my good wife of twenty years objected most strenuously —and the amount of money which I would earn in the next twelve months. It was an alluring sum, and I immediately felt favorably inclined toward the glassy-eyed dame of uncertain age and antecedents who so cast my manual horoscope. This was the future as outlined by my hand in its pristine condition, merely well washed, a precaution which I learned from the palmist was unnecessary, since "no effort of man could conceal the facts which the palm reveals."

Thereafter I went home and devoted much of the next three days to working on my "life lines" with the paper cutter, and to elevating the mountains of the planets by massage with the other and still innocent hand. When I had added to each line and to each mountain enough of depth and length and width and height to change my future as much as I believed it should be altered, I took another dollar from the family purse and went to another palmist. My work was a perfect success, and I received another and entirely different fortune. Thus, I had two futures before me, without the ability to choose either one. I determined to have a third, and, giving the hand a week's rest, I worked up only one hillock, the "Mount of Venus," just at the base of the thumb, and altered one line, that of "life." This won for me a third and still different future fortune from a third and different palmist. It seems to me that this simple experiment, which any one can perform, shows the value of palmistry as a key to the future.

Fortune telling by crystal gazing —staring fixedly into a clear glass globe, a bowl filled with water, a pan of mercury, or at some other clear and smooth surface, on which images are supposed to appear—requires a little more paraphernalia, and, consequently, demands a higher fee. One can have his fortune told by the cards for fifty cents, by palm reading for one dollar, and by crystal gazing for two to two and one-half dollars. The Oriental humbugs, the Swami This and the Swami That, and their sort are very fond of the crystal globe. This is a form of autohypnosis, when honestly carried out; but as done by the average fortune teller it amounts to nothing but a matter of staring fixedly into the crystal for a few moments, the muttering of a forecast of the customer's future, and the collection of the fee. The writer, though able to put himself to sleep by gazing at a pin-point of light reflected in a mirror, and to perform other similar tricks of self-hypnosis, has never been able to obtain anything but a stiff neck from gazing into the crystal ball.

Scientific investigators, who have made long tests with the crystal ball, the mirror, the mercury pan and similar equipment, have informed me that they never have been able to conjure up images of anything except scenes and persons that they had viewed in this world. This probably is the extent of the value of the crystal ball—merely a concentration point for the operation of the subconscious mind, or whatever mind it is that serves as a filing cabinet for human thought and memories.

Slate writing, one of the most effective tricks of the modern conjurer and sleight-of-hand performer on the stage, and for many years one of the best money-getters of the fake mediums and other pretended communicants with the spirit world, can be done in twenty-seven different ways. The writer has attended seances in which he has seen thirteen of these methods used, and was able to detect ten of them, being told of the remaining three by the "medium," who believed that the writer was also in "the profession." The writer has received "spirit messages" on slates furnished by the medium, and on

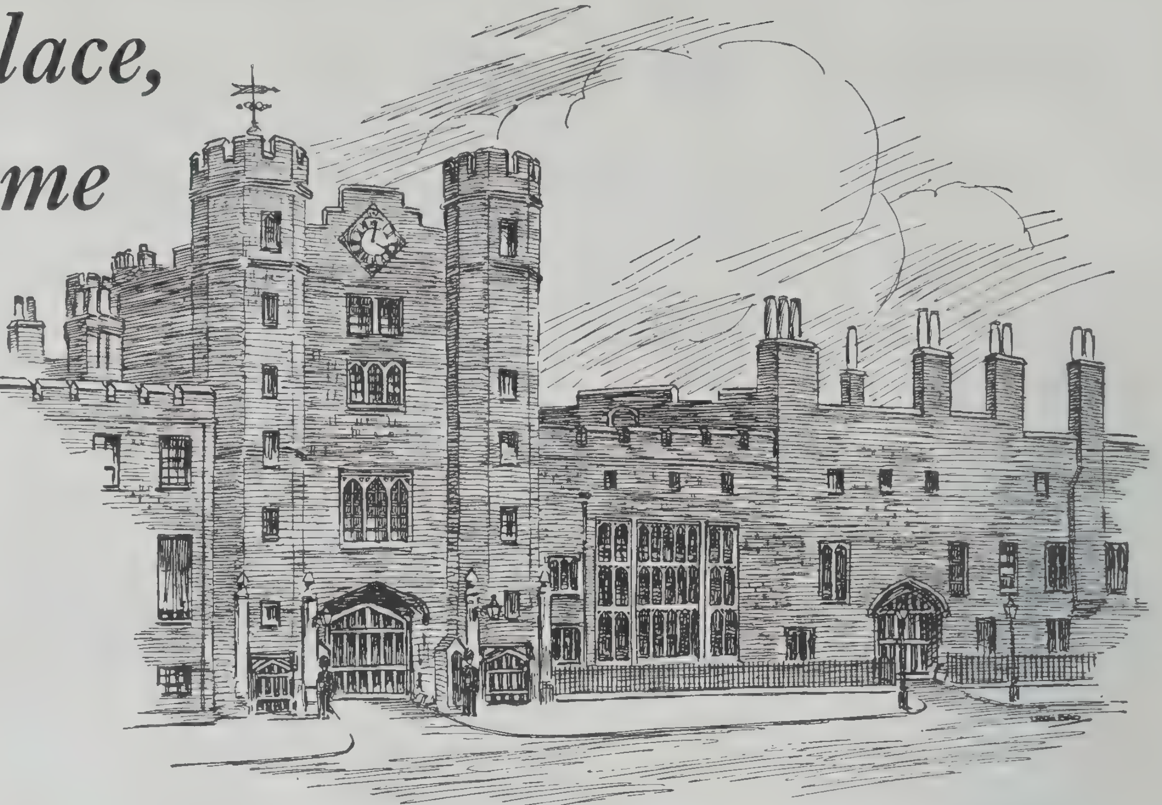
St. James's Palace, the Prince's Home

By W. TEIGNMOUTH SHORE

Drawings by L. Pern Bird



The beautiful gateway on St. James's street, supposed to have been built from the designs of Hans Holbein.

I DON'T think I should like to be a king and have to live in a palace! It must be very trying to be shackled with ceremonies and straight-waistcoated with state; and palaces seem to be rather inhuman, ice-housey, too formal dwelling-places. If I were a king, or a prince, I'm certain sure I'd often kick over the traces, get up and shout highly undignified shouts, and be shocking just to shock. But, there, probably if I were born and bred to a throne I'd feel quite different about it!

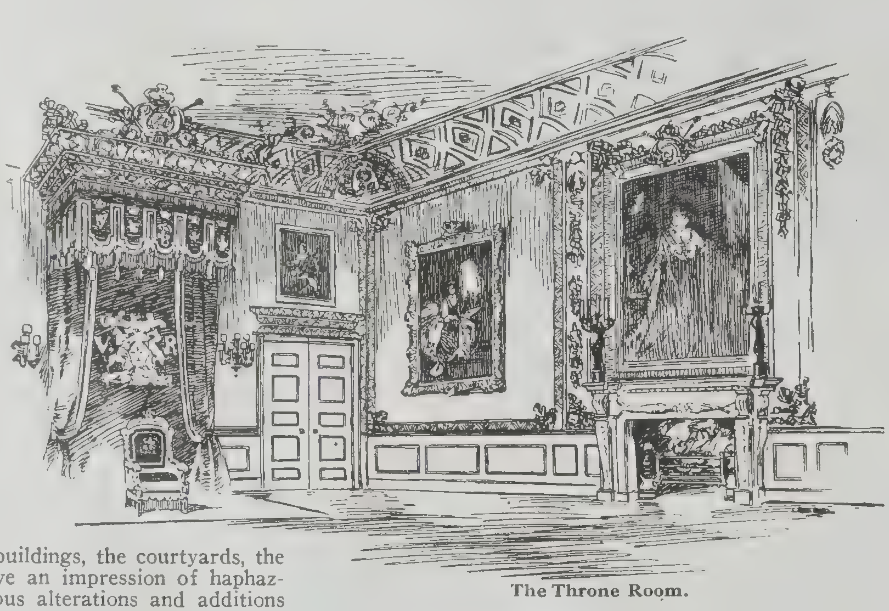
Such feelings, however, did come upon me the other day when I spent an hour and more in Saint James's Palace—a quiet, Old World spot amid the roaring life of London. Quiet on one side because it looks over Saint James's Park; and also on the other despite the fact that it faces Saint James's street, the center thoroughfare of Clubland.

This palace is not imposing outwardly. Looking at it from the Processional road in the park, it is a demure red-brick frontage, with ranges of unenterprising windows; quite homely. Long ago it was known as the House in the Fields; on the verge of the country outside the town; and on this site stood a spital, or hospital as we now should call it, dedicated to Saint James the Less, Bishop of Jerusalem. Therein a refuge was provided "for fourteen sisters, maidens, that were leprous, living chastely and honestly in divine service." But that burly ruffian Henry VIII did not hold chaste maidens in any great respect; he cast his thievish eyes on this desirable spot, close by his Palace of Whitehall, and in the year 1532, the twenty-third of his reign, he compounded, without their permission, with the "mayden lepers," granting them pensions for the terms of their lives and entering into possession of this Naboth's vineyard. He built himself a goodly manor house and inclosed the adjoining fields as a park with a wall of brick.

It is better to approach from St. James's street, for we then come face to face with the most important survival of Henry's building, the beautiful gateway, with the octagonal towers, and carvings exhibiting the initials of Henry VIII; e whole may be from e designs of Hans Holbein. Whoever's conception it was, it is one of the most interesting bits of Old London. The buildings, the courtyards, the passages of the palace, leave an impression of haphazardness, the result of various alterations and additions and repairings made by Charles I, Queen Anne, and the Georges. Irregularity in an old building is always more interesting than formality; it proves that there has been growth with the passage of time and the passing of those who dwelt therein. The lack of regularity is not quite so obtrusive within doors. Despite the splendor of the state apartments, many of which look over the park, there was something chill and somber as I walked through them one cold, April day. I felt as if in a house that was deserted; though bright fires blazed on broad hearths there was no warmth in the air; the chairs, sofas, settees, looked as though no one could sit comfortably on them; from heavy picture frames the eyes of the dead looked out rather dolefully. But, lights, gentleman, lights! The chandeliers and sconces shed a brilliance that dispersed all shadows; ladies and gentlemen in courtly array, princes, princesses, statesmen, soldiers, ecclesiastics; the wise, the weak, the wicked, pass from room to room, hushing their chatter when they bend low before the throne of king or queen. Henry aforesaid has held his court here; also William III; Mary of Bloody memory liked this palace well; and some of the Georges; and others have walked these floors.

Up the broad lonely stairs, we go, almost afraid to speak in this abode of silence, so filled with mingled memories. Through the Guard room, hung with shining weapons; anon we pause in the Tapestry room, once known as the Presence Chamber. The walls are draped with tapestry worked at Mortlake on Thames for Charles I, depicting the amours of Venus and Mars. This room is additionally noteworthy as being at any rate in part a remainder of Henry VIII's manor house; there on the handsome old fireplace are carved the initials H. and A.—Henry and Anne Boleyn—united by a true-lover's knot! The irony of it! If one were here in the dead hour of night, what spirits might there not be, visiting the glimpses of the moon? Heartless Henry and heedless, headless Anne; Charles I, who too lost his head, and many another monarch dead and gone. Here from a window looking over the Friary Court, on the morning following the day of death of a monarch is announced the accession of his successor. *"Le Roi est mort. Vive le Roi!"* So wags the world away!

We pass through the lofty, gorgeous chambers, which echo to our footsteps and from which it is almost a relief to look out on the park, where the roadway is alive with an increasing stream of traffic—to look out through the half-shut eyes of this ancient house at the eager life outside. On through Queen Anne's Drawing Room; through the Great Council Chamber; so into the Throne Room. Then suddenly it is as if the sun had broken through the clouds, and there blazes forth the splendor that is England, in this gorgeous apartment, where stands the Throne of England beneath its fine canopy. Here the King holds his Levees, when ambassadors and ministers of state throng to be presented to him, the ruler of the widest empire the world has yet seen. In our mind's eye we see it, brilliant with light, resplendent with magnificent robes and uniforms, crowded with great names! The kings that are dead, let them lie in peace—Long Live the King!

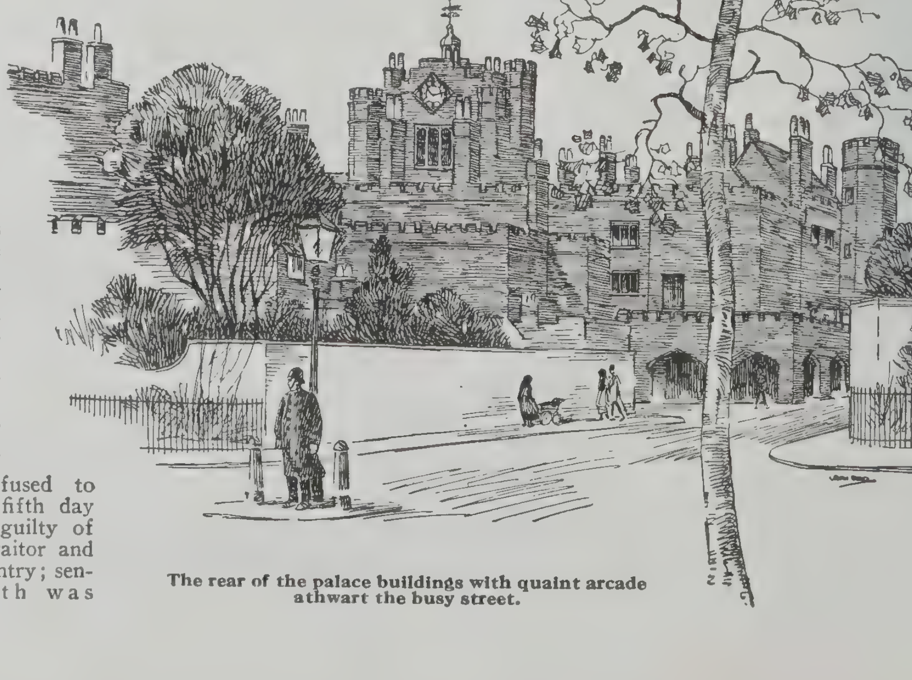


The Throne Room.

Beyond this the Royal Closet, the King's private room; and the Boudoir of the Queen; the Picture Gallery, hung with the portraits of English kings and queens, King Hal at one end facing Queen Victoria at the other, quaint opposites in all save strength of will! And the Banqueting Hall, dim and forlorn by day, ablaze with pomp and circumstance when the King presides over a stately company and welcomes them to good cheer.

How much of the history of England has marched through these chambers! We can look at but two memorable incidents—one of pure tragedy, one tragicomical.

In his palace of Saint James, King Charles I passed his last days on earth, a king without a throne, yet not without loyal subjects still. He was brought here from Windsor on the morning of January 19, 1649, for his trial which began at Westminster the succeeding day. He denied the competency of the court; refused to plead; on the fifth day was adjudged guilty of being tyrant, traitor and a foe to his country; sentence of death was passed. On January 29, he bade farewell here to his children, the Princess Elizabeth and the young Duke of Gloucester; they weeping bitterly and lamentably crying as they looked their last on the grave, melancholy, sweet face, the countenance of a king who was hallowed by his death, which he met with more manliness than he had faced life. This last night he slept well until two hours before the wintry dawn, when he awoke and said to his attendant: "I will get up, having a great work to do this day." So, forth, guarded by a regiment of soldiers, into the white frostiness of the bitter morning, to the scaffold set up before the Banqueting House of his Palace of Whitehall. And there—the end.



The rear of the palace buildings with quaint arcade athwart the busy street.

Fifteen minutes before ten o'clock on Trinity Sunday, June 10, 1688, a son was born in this palace to James II and his Queen, Mary Beatrice of Modena, a man but poorly known to fame as the Chevalier de Saint George, the Old Pretender. Better for him had he never entered a world he did not adorn and which did not treat him respectfully. Even his birth was surrounded by that ill fortune which dogged him to the tomb. For it was said by many that he was not in truth the offspring of the queen, but an infant of humble parentage smuggled into the royal bed in a warming-pan! Wherein is laughter, dashed with lamentation!

Other princes have been born, have died here: Henry, Prince of Wales, son of James I, died in 1612; had he lived the history of England and of the House of Stuart would have run very differently. Charles II was born here in May, 1630, and James II some three years later. George IV was born here, the first and least gentleman of Europe.

Better now turn away from a past of sunshine and shadows to a present that is all the former. On July first, 1919, Edward—known in his family as "David"—Prince of Wales, took up his residence in Saint James's, in his twenty-fifth year. The portion of the palace which he occupies is known as York House, overlooking on one side Cleveland Row which opens off Saint James's street, and on the other, Ambassadors' Court. Here some of his early years were spent, when his father, now King George, then Duke of York, resided in the same apartments. By the way, it may be noted that his grandfather, King Edward, asserted that his grandson was "infernally bumptious"! But that was some years ago!

The Prince's rooms and the life he leads are those of a typical well-born, well-endowed English gentleman, and indeed a big portion of his great popularity is due to his being "one of us." The entrance is through a square hall, wherein may be noted some souvenirs of the Great War, among them the bass drum, two side drums, and two bugles of the Prince's regiment, the Grenadier Guards, to which he was gazetted as Second

Black Africa Being Unified by Strange Force

Ethiopian Church Binding the Negro Peoples by Racial Consciousness; Rapidly Increasing Native Population a Problem for Future Statesmen

By THOMAS C. TAYLOR

OF THE many movements of political and social importance which are claiming attention at the present time, one of the most interesting has been accorded somewhat less of notice than its position seems to entitle it to. Throughout all the squabblings of Europe's vociferous national groups, and the commotion brought about by the development in Russia of that new and uncompromising imperialism which claims no less than the whole world for the Bolshevik brand of *kultur,* a great force bearing upon the future of all Africa has progressed steadily.

Looking at its record of the past twenty years, one finds in it a force characterized by *vigor without aggression.* It has not burdened the wires of the world with its propaganda. There is no evidence that it has struck at liberty of thought a single blow. It has not cleared a way for itself over the bodies of men slain. Its function has been not to scatter and crush but to gather and bind; and it is binding the Negro peoples of Africa to a purpose and a racial consciousness of much moment. It is the Ethiopian Church: Ethiopian, for the Ethiopian.

In its name there is the measure of its aims and the range of its outlook. It uses the title "Ethiopian" in its widest and historic sense. This church is not a growth of that so-called Ethiopia on the borders of the territory of Abyssinia's ruler; and that is not its field. When imperial Egypt stood among the mighty of the earth, there lay far to the southward beyond the great S bend of the sacred river a black, unknown and dreaded land—Ethiopia. The imperial emissaries roved its fringes only, taking thence ivory, precious metals, and wild men.

The Gift of the White Man

THE centuries passed, and imperial Egypt went down before the hosts of Persia's great Median empire; but to the conquerors, as to their victims, *world's-end* was on the border of the southern wilderness known vaguely as Ethiopia. Then Macedonian Alexander had his day, and the empire of Greece stretched from India to the heel of Italy, with Egypt a vassal kingdom, and "Ethiopia" still but a name or the unknown land whence came the Nile.

Alexander "abode his little hour or two, and went his way," and the thrusting Romans came to fringe the whole Mediterranean with a deep broidery of conquered territory. They held Aegyptus, but to them also the designation "Ethiopia" signified all that vast continent of Africa bordering upon and south of the Equator.

To the Ethiopian Church, "Ethiopia" has that meaning still. Its field is all Africa wheresoever Ethiopians have need of it: 5,000,000 square miles of territory in which it will not encounter predominant Mohammedan interests, and 70,000,000 people not Mohammedanized.

In its origin, this great factor in the future of Africa is the gift of the white man to the black. It is essentially a product of the Christian mission. To spread the broad teachings of Christianity, to educate and train native teachers and preachers, devoted white missionaries suffered and toiled, gladly.

The processes which in the course of years have brought about the withdrawal of many such mission-trained black people to a line and organization of their own are invested with a certain measure of inevitability. Those processes have their parallel in the history of the contact of every white people with native races to which they have brought a deep draught of the ideal—"Children of one Father, we"—and a small dose of education.

There must be further frankness, however. If, under the impulse of the new ideal and a limited education, there came an over-deepening of racial consciousness here and there, with its tendency to racial assertion, account must be taken of the concurrent effect upon the native mind of the differences he experienced between the teaching that "all men are brethren" and the status in which he found himself under the whites. There was much that mystified him; much that he could not reconcile. Out of these things the opinion grew that a church organized by black men for black men was necessary. At the least, black men would be brethren there, *and equals.*

The First White Nurse

OF THE multitude of mystifying things presented to the native mind in his contact with the whites who came on the trail of the early missionaries, one may be given as an example, from the personal experience of the writer. Through the fever-laden bush country of a district on the east coast of Africa, a score of white men had pushed up to the ranges to found a town. A great white missionary had once passed that way, and his repute and his teachings lingered. The pioneer group, alike in type and purpose, worked as brothers, and the town was established. The district opened, the town grew, and a hospital became necessary. The first white nurse came to reign and the tone of the little community brightened. Later on, government officials appeared with their wives, and in due course a church was erected. It was then that class distinctions, social circles and inner circles came into being to break the hearts of the pioneer brotherhood. One of the hardy founders died. He had been a grand fellow, clean of life and purpose, and he bore in his body the marks of conflict with wild beasts and of much suffering in the planting of that outpost of his race. He had belonged to a Christian church; but it was not the kind of church which he had helped to build in the new town. The incumbent on the spot decided that the pioneer could not be buried in consecrated ground, and, as the community's little cemetery had become the monopoly of the new ecclesiastical institution, a grave was dug outside the walls of the cemetery and the gallant crusader of a wider faith was laid there. The news spread, and within a few hours the pioneer group were at the spot with native helpers. They tore down the wall of the cemetery and rebuilt it to inclose the grave. They called the startled and outraged representative of the Christian religion to the scene of their operations, and warned him that any interference with the alteration would mean the tearing down of the church building itself. The natives were amazed at it all. In fact, it was found utterly impossible to explain the whole business to "the heathen in his blindness."

Haven for the Disillusioned

THE conditions which drew together the varied elements of native feeling, and consolidated them into this ministry by Ethiopians to Ethiopians, contributed so freely to its growth that the extension of the organization seems to have taken place almost without deliberate and designed effort. Examining the wide and remarkable development of the movement, one inclines to the view that had it not emerged to meet the needs of the time, some other movement of kindred character must have taken shape in South Africa. The field was favorable. Everywhere, under the impact of the white advance, the native mind was stirring. Ideas planted by the missionaries took healthy root, only to be uprooted without much ceremony by the general body of the whites who followed, and there came a deal of surprise, and disillusionment and bitterness. Education progressed, and with the increase of knowledge there arose questionings and dim aspirations, and resentment of barriers. With the coming of the native press the forces leading to general awakening were greatly strengthened, and aspirations became more definite and articulate. In the midst of it all, the Ethiopian Church lived and grew.

A haven for the disillusioned seeking expression and sympathy, people turned to it and found what they desired; a place of understanding to which those awakened to independence of feeling and consciousness of old-time power could bring their ideas without fear, it held all who came. Like a great magnet, seemingly inert, it lay there in South Africa and drew to itself everywhere the particles of the ore of native spirit, and intellectual enlargement, and educational development, as these were laid bare by experience and contact with the changing order. Of itself, the Ethiopian Church does not appear to have been concerned with the rôle of awakener. Operating to its enlargement were mighty forces over which it could not hope to exert influence. As a refuge of the awakened, its function was large enough. And it held its arms wide, instant to the ingathering.

Center of Sympathy

THERE is not a Christian mission in Africa south of the Equator which has not at some time or other contributed to the numbers and efficiency of the Ethiopian Church. It has been a wide experience that sooner or later the call of color and race comes with great insistence to the product of mission station and school.

Hearing once some converted boys of rival denominations in a considerable South African town slanging each other whole-heartedly across the breadth of a street, a white visitor laughed and ventured the view that if that sort of thing went on it could be expected that denominational differences would ultimately take the place of the old tribal differences, and might even prove as troublesome.

"You are mistaken," said an old Dutch colonial; "at this time those youngsters are ardent supporters of their particular denominations; but they will meet later on as brethren in the Ethiopian Church."

Yet the Ethiopian Church did more than act as a center of sympathy and a refuge of the intellectually and racially awakened. Turning to the "raw material" of the mission sphere, it found, as the white missionaries had done, "broad lands strangely ready for the plow." South Africa, from the point of view of the missionary, was a simple problem as compared with the Far East. There was no code-drift or creed-drift of the ages heaped high upon human life; no towering walls of faiths older than the Christian confronted the missionary; no barriers of caste obstructed the path to a conception of brotherhood. The pride of Africa's fighting tribes had been humbled though by no means eradicated, and wars with the whites had brought a new conception of what war meant and a changing attitude on the part of the tribes toward each other—a turn toward unity. When the Matabele and the Mashonas united in war against the whites, the lesson was no less amazing to the whites than to the tribes in general, for the Matabele had regarded the Mashona as something of a jackal, a person not to be associated with, least of all in the "honorable enterprise of war." To the Ethiopian Church, the impulse toward native unity, thus indicated, became a source of strength. *War between the whites afforded a spectacle which added to that strength, in the education of the native.*

Following upon the British war with the Boers came one of the most important points in the history of the Ethiopian Church, when there met at Aliwal North in the Cape Colony a great convention of the representatives of the movement to shape a policy of more active and positive character. The convention revealed that, almost without effort on its own part, the Ethiopian Church had cast a light net over all South Africa from Cape Town to the Zambezi, and was reaching northward toward the lands on the Equator. It was found that even then it could claim influence over many hundreds of thousands of persons in all parts of the country, and gave promise of being the greatest unifying force in Black Africa.

The realization of its unexpected greatness and power came upon that convention with tremendous effect, and one of its most important results was an outburst of missionary enthusiasm which since then has carried the Ethiopian Church into practically all of that five million square miles of "non-Mohammedan" country, and placed it at the service of the bulk of the seventy million persons who may need such service as the church has rendered in the gradual awakening of the South. Testimony to its vitality is afforded by the large number of men who have gone out from it as unpaid and even unofficial missionaries to remote and uncomfortable places. The writer found one such working independently on the banks of a remote river three thousand miles away from his native village; drawing neither sustenance nor pay nor instruction from the church, but proud to explain—"I am of the Ethiopian Church, sir, and hope some day to report that we have a branch here." Thus is explained in part that in membership and adherents and in numbers under its influence the Ethiopian Church at this time can claim that under its banner there are native millions. It does not advance the claim, however. It says nothing and saws wood.

What of the Banner?

WHAT, then, of the banner of the Ethiopian Church? It has been accused of political rather than religious aims. Utterances of isolated members have contributed to the statement that its aim is "Africa for the Africans" rather than the spiritual welfare of its people. Some observers regard the whole movement as something of sinister purpose, silently gathering its powers and directing its operations toward the supremacy of the black. Others recall with significant emphasis that one of the greatest fighting peoples of India—the Sikhs of the Punjab—arose from a religious body such as the Ethiopian Church. For much of such suspicion the loose talk of the church members is to blame; but considering the varied elements which have been drawn to the church and have entered into its composition, and the readiness with which loose talk assumes importance in a land where the black majority ranges from 3 to 1 to 400 to 1, suspicious interest is understandable.

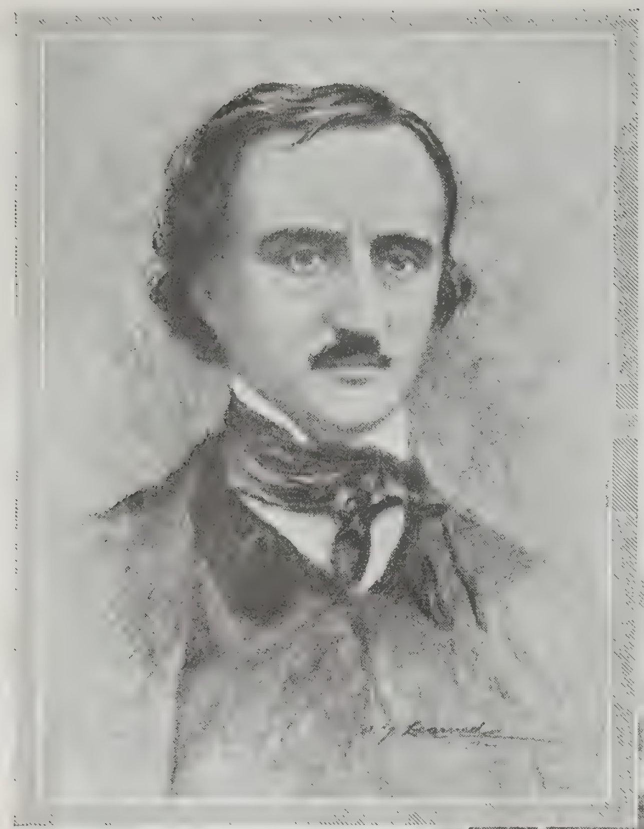
From the talk of individuals under the urge of their particular fad—from the buzz of the individual bee under the entirely personal headgear—one may turn to the record of the Ethiopian Church in seeking that which it desires to do from the history of what it has done. It proves to be a record of the achievement of power without aggression. The church grew because it was in being at a time when a great race, awakening to a realization of purposeless existence in a subordinate position, was stirring vaguely; and it gave direction to the stirrings. That it has given peaceful direction is undeniable. That it has moved with a dignity that has been an example and an inspiration to all the elements composing it—and something of a lesson to some of the elements criticizing it—is a conclusion in accordance with the available facts. It has fulfilled all the functions of a church, shown the black the value and the power of unity, and been a disseminator and conservator of Negro self-respect.

Great Potentialities

THE great potentialities of this widespread organization, for good or ill, have been deeply impressed upon South Africa. The danger of some new impulse capturing and sweeping this, the greatest body of united blacks ever built up in South Africa, cannot be lightly dismissed, and in the minds of the responsible whites, in the midst of their political differences and scramblings, that danger is seldom obscure. The Union seems to have turned of late to a keener interest in the future of South Africa rather than in the past and present of Europe. That seems to be a useful change, for among South Africa's problems none looms larger now than that of the vital and rapidly increasing native population, and the day seems to be nearing when Africa will need not politicians but statesmen.

Where the Poet Poe Lived and Suffered

By AARON HARDY ULM



EDGAR ALLAN POE

From "Edgar Allan Poe, The Man," by Mary E. Phillips.

ONE might paraphrase the great line in Kipling's "The Light That Failed" and say that Edgar Allan Poe's ill luck pursues its object still.

Not until 1921, after numerous other writers had been admitted, did the Fates that contend against his memory as they did his fortunes during his lifetime permit his entry into the Hall of Fame.

More than seventy-five years had passed before the city of Richmond, Virginia, which is most associated with his life and work, did anything toward perpetuating any outstanding memorial of him there.

In Baltimore, the ancestral city of Poe's family and where the poet died, Poe's body was permitted to lie in a neglected and but feebly marked grave until recently. Then when a modest monument was erected on the spot, it was marked with a quotation muddled by an error from one of his poems.

Recently, in Poe Park, named for the poet, in New York City, the writer noticed in a corner of the small inclosure a boxed-up object that suggests a fire-fighting apparatus housed securely in the open.

"It holds the pedestal," the writer was told, "on which used to sit a bronze bust of Poe."

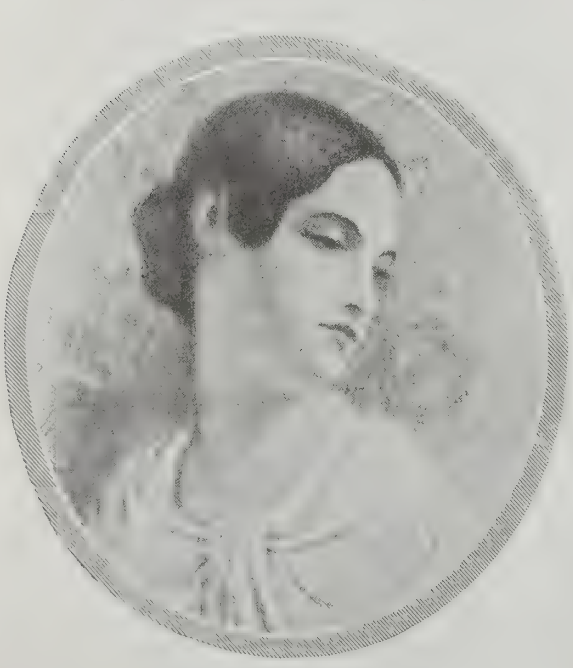
"Then why is it housed from view in this crude manner?"

The informant then told a story which could have supplied Poe a clue for a yarn as weird and mysterious as "The Gold Bug" or "The Murders of the Rue Morgue."

"One morning," the informant went on, "the caretakers of the park found the bust missing from the pedestal. A search was made far and wide but no trace of it could be found. Some time later in another part of the city, a crew of Italian laborers in cleaning out a sewer brought to view a curious object. It was the Poe bust! Somebody actually had torn the bust from its place in the park, carried it away and then thrown it into a sewer."

Imagine the story which Poe might have built from an incident like that!

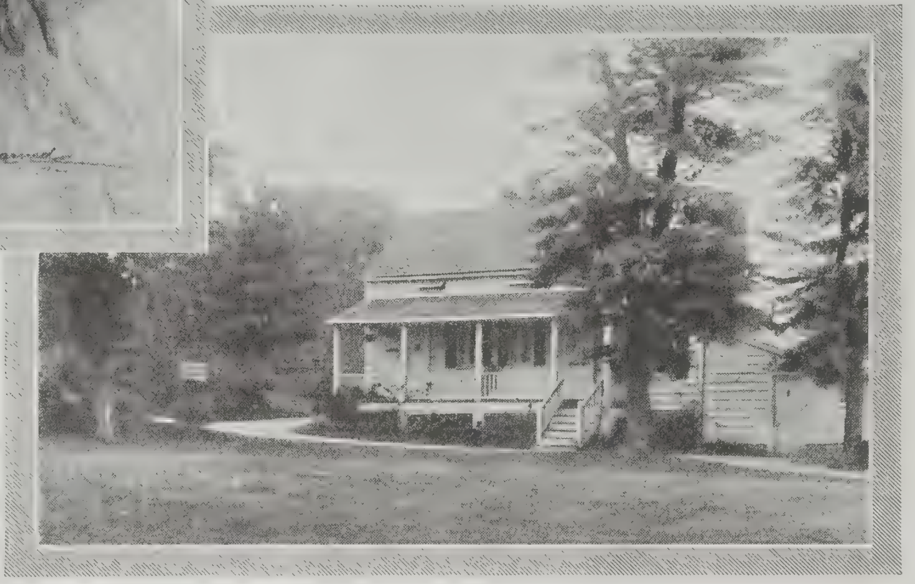
No one yet knows who did it or why. Since then the bust has not been placed in the open but in a house that is locked and barred every night.



VIRGINIA CLEMM POE

From the photograph of water color sketch.

That the removal of the bust was not the work of some idle vandal or a person drunk and irresponsible is indicated by the sequel—for not long thereafter, the caretakers of Poe Park discovered one morning that during the night some one had entered the park and with an ax or heavy hammer had apparently tried to break the pedestal into pieces. The stone pillar was badly chipped and marked from the blows which had fallen upon it.



Poe Cottage in Poe Park, New York City. The home of Edgar Allan Poe, 1846-9, built about 1800, moved from original site across Kingsbridge road to Poe Park 1913.

Now it is housed from view—and access.

Poe Park is a small, square-shaped spot in the center of the boulevard known as the Grand Concourse in that part of New York called the Bronx. It constitutes a memorial of Poe's last and best recollected home. The tiny house in which the poet lived during the last three years of his life now sits in a corner of the park and is open to visitors.

This house is the most memorable relic of Poe's life which survives. Its history since he occupied it has been fitful like that of the man whose occupancy caused it to be preserved.

When it was rented at a cost of only $100 a year by Poe, the house, which was a modest one for even that time, stood by what still is known as Kingbridge road, a rural thoroughfare out of the village of Fordham about a dozen miles from New York City. The district then was a farming community as it remained until recent years. Now it is a fully developed part of the great city, being filled with big apartment houses and pierced by subway and elevated railroad lines.

The Poe cottage was preserved largely through accident. Long ago it was moved from its original site on which an apartment house now stands. For many years it was owned by Dr. E. Chauvet, a Fordham dentist who took an interest in literary lore, who preserved it largely for reasons sentimental.

Admirers of Poe knowing that the sweep of progress ultimately would destroy the cottage unless steps were taken to preserve it permanently began, more than thirty years ago, a movement looking to its acquisition and dedication to the public. The Shakespeare Society of New York City took a leading part in the early movement.

The cottage was shunted from back lot to back lot in making way for apartment houses, now occupied largely by immigrants, until in 1914 it was moved into Poe Park and given a permanent site. This site is public ground, being supplied by the city, which also provides light and heat for the cottage which is owned and kept up by the Bronx Society of Arts, Sciences and History. Upon contributions made by visitors, its maintenance chiefly depends.

Through the efforts chiefly of Mrs. Charles D. Dickey and Mrs. John Jay Chapman the cottage was restored and is now, with minor additions, just as it was when occupied by the Poes in the late forties of the last century.

The little cottage is visited daily by admirers of the great American writer. Conspicuous among the visitors are foreigners, among whom Poe attained high rank and by whom, particularly the French, he is probably more widely read and admired today than by Americans. Scarcely a noted man or woman of letters from Europe ever visits New York without making a trip to Fordham to see the house where Poe wrote several of his greatest productions.

"The thing that astonished me beyond all else in my tours around New York," said Vicente Blasco Ibañez, the famous Spanish novelist, speaking at the Poe cottage recently, "was the fact that nowhere could be seen a statue or memorial of any kind to that great American, Edgar Allan Poe."

The Poes—the poet, his child-wife, Virginia, and his mother-in-law, Mrs. Maria Clemm—took up their residence in the Fordham cottage in 1846. Prior to that and following periods in Richmond and Philadelphia they lived in New York City. The Poes moved into the country largely because of Virginia's health, though economical reasons probably had something to do with the change. Poe's wife was then in the last stages of consumption from which she died a year later.

Poe himself suffered much but not constantly from ill health during the same period. Though when he went to Fordham he had established national recognition as a literary man, the three last years of his life spent there were, like most of the others, marked by pecuniary difficulties which at times were so harsh that neither he nor his family could afford all of even the barest creature comforts. His necessities even reached the point that his friend, Nathaniel P. Willis, felt constrained to make a published bid for charity for the man who not long before had penned "The Raven," generally regarded as the greatest poem ever written by an American.

Yet while at Fordham Poe did some of his best-known writing. Among his stories, "The Gold Bug" was put forth from Fordham. The three poems which next to "The Raven" are best known were written there. These are "The Bells," "Ulalume" and "Annabelle Lee," his last and many believe his greatest production.

And it was there that he wrote the prose work upon which he proposed to rest his fame but which is rarely read now. It is entitled "Eureka," in which he undertook to solve the riddle of the universe. For a long time this unique product of Poe's strange brain was regarded largely as a reflection of the touch of insanity which at times clearly affected him. Yet he gave visions therein of monumental discoveries since made by science, such as the subtle power which adheres to atoms and, though only vaguely, the electronic make-up of the atom itself.

Now and then the cottage is visited by an old woman, Mrs. S. W. Fairchild, who still lives not far from there. Occasionally, also, an old man—Hugh Conner is his name—comes to look upon it.

These probably are the only living persons who knew Edgar Allan Poe, for Dr. Gildersleeve, of Johns Hopkins University, who was acquainted with him, died recently.

Mrs. Fairchild lived as a child in the neighborhood during the days of the Poes. Mr. Conner as a youth was a coachman for a wealthy family of the neighborhood and tells how he drove his mistress to the Poe cottage with flowers and tidbits for the dying Virginia.

Though Poe often yielded to temptation while at Fordham, many who knew him well at that time left evidence which shows that he was by no means the dissipated man posterity still believes him to have been. Willis, who knew him best of all and worked with him for a long period, said that he never once saw Poe under the influence of stimulants.

After Poe's death, Mrs. Clemm, his mother-in-law, to whom he had been much devoted, continued to live in the cottage until she was forced by necessity to take refuge in a benevolent institution where she died. Returns from the books he left proved insufficient for her support, yet single copies of first editions of several of them now often bring enough to have met her expenses for a number of years.

MRS. MARIA CLEMM

From a Daguerreotype

Mr. Ford's Page

IT IS fundamental that we should cease to confuse Big Business with the Money Power. They have nothing in common. They represent two tendencies. They have always been at enmity with each other. In this country they have had their supreme struggle, until now Industry or Business emerges as the superior of Finance.

The difference between them, on the plane of money, can be best indicated by the difference which exists between "live" and "dead" money. The money that takes no risks in an industry, but demands its toll whether there is profit or loss, is not "live" money. It is not whole-heartedly in the business, as a part of it; it is a burden and a debt upon the business; it is a dead weight, and the sooner the business is quit of it, the better. "Dead" money is not a working partner but an idle charge, and oftener becomes a liability than an asset. In other words, it is a debt and not an investment.

"Live" money is just the opposite. It goes into the business to work and to share all that befalls the business. It is there to be used to its last ounce of utility and to be sacrificed at the last ditch, if need be, to save the business. It shares whatever losses there may be. It is a whole-hearted partner, for the service of any plan deemed wise. It is asset to the last penny, and never a liability. It buoys up the business, instead of pulling it down. It does not represent an element which some day must be wrenched loose, and which constitutes a drain while it remains; its service is continuous, and when it grows, the increase is gladly dedicated to the same purpose as the original capital.

MAKE it very clear to yourself, the difference between Business and the Money Power. Business begins by itself, grows because it fills a need, extends and becomes big by reason of the people's patronage. No great business today was started or fostered by any Money Power. Only when Industry shows promise of big dividends does the Money Power seek to fasten sucker-plants to its prosperous flanks. So that the danger point in business is success: then the question arises, Whom will it serve?—the people who gave it its start, or the Money Power that waited for it to succeed? One way means debt and absentee dividends and decreased service; the other way means sharing the values of the business with the people. The latter is "good business." But how far this divides Big Business from the Money Power can be seen at once.

"Live" money in a business is usually accompanied by the active labor of the man or men who put it there. "Dead" money is a sucker-plant for those who never intend to work in the business.

Now it is plain that when Industry operates wholly by the permission of "dead" money, its main purpose becomes the production of dividends for the owners of that money. The service of the public becomes secondary. If quality of goods jeopardizes dividends, then the quality is cut down. If full service cuts into dividends, then service is curtailed. This is the way the "Money Power" affects business. *It does not serve business, but seeks to make business serve it.*

It becomes plainer, therefore, that to confuse Business with the Money Power is to make one thing of two, and to unite elements which naturally oppose each other. A business cannot serve the public and the Money Power too; and, as a matter of fact, the Money Power has always lived more by exploiting or wrecking Business, than by the serviceable and successful management of it.

There is another difference between Big Business and the Money Power which should not be overlooked, namely, that Business begins in itself, is born of its own idea, grows of its own initiative, flourishes on the support of the people, and is not created by any Money Power. Think if you can of a single great industry operative today that was deliberately created and fostered by the Money Power. You cannot think of one. Every business began lowly, grew because it filled a want, and if it attracted the attention of the Money Power at all, it was only after growth had been attained, when it promised to be a fruitful field for unearned dividends obtained by means of loans of "dead" money.

It is always regrettable to see a useful business succumb to the lure of those who wish to affix financial sucker-plants to its prosperous flanks. A business which can bring itself to the point where it attracts the attention of "dead" money should be able to continue on its own feet without taking on this useless and dangerous burden.

The regret deepens into a sense of the injustice which this works toward the public. It has just been said that the Money Power has developed no great industry from the bottom; it has always been the spirit of Business that has done that. But, if it is only when an industry has grown large and prosperous that it attracts attention from the Money Power, who then finances the industry in its earlier years? Who pays for the experiments, the improvements, the expansion?

Answer that question and you define something worth knowing, worth thinking about.

The answer is—The People. No one else. There is none else to do it. They are the financial supporters of all new Industry, and to them, not to a Money Power, does Industry owe its service when it succeeds.

If we have good steel today, it is because the public bought steel when it was faulty, and thus helped the steel masters to perfect their science and production. If we have comfortable transportation today, it is because the people were willing to pay for uncomfortable transportation and let the system grow up. If we have swift, durable and dependable motor cars today, it is because the people bought motor cars when they were largely in the experimental stage, when to use a car was to be something of an innovator, and it was this early and courageous patronage that enabled the motor industry to develop and improve its product and bring production to such perfection that the whole public could be served. If we have the varied products of petroleum today, it is because the people bought and burned "coal oil" and by their confidence and patronage set the oil industry on its way to worldwide service.

Every great industry thus grew because the people recognized that here was a useful service. And for this reason it is the people who should most profit by the economies and perfections which their faith and patronage made possible.

It is just when an Industry becomes widely useful that its strongest testing comes. It is led up into the mountain to be tempted. The Money Power will point it the way of large stock issues, of profits made out of paper instead of production, of easy gains by mixing "water" with true material worth. This is a temptation to which many concerns succumb under the delusion that it is "business." But when once the bait is swallowed, the concern discovers that henceforth it cannot fully perform its duty to the vast public that created it, for now its duty is to the power that caught it in the mesh of debt.

The true course of business is to follow the fortunes and pursue the service of those who had faith in it from the beginning—the public. If there is any saving in manufacturing cost, let it go to the public. If there is any increase in profits, let it be shared with the public in lowered prices. If there is any improvement in the commodity, let it be made without question, for whatever the capital cost, it was first the public that supplied the capital. That is the true course for good business to steer, and it is *good business,* for there is no better partnership a business can enter than a partnership of service with the people. It is far safer, far more durable and more profitable than partnership with a Money Power.

It is now perhaps entirely clear how far from the truth it is to confuse Business with a Money Power, and to attack Business on the theory that thereby the grip of a Money Power can be loosened. The best defense any people can have against their control by mere Money is a Business system that is strong and healthy through rendering wholesome service to the community. Where Business languishes or is ill-managed, there you will find the Money Power in control. Business as a national defense against economic over-lordship—think it over.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Senator LaFollette

SENATOR LAFOLLETTE has opened his campaign, well cheered on by the Socialists and Bolshevists of New York, ably abetted by the Hebrew Clothing Trades. More than ever did his speech reveal the paucity of issues in this campaign. If anyone should have a fight to make and proposals to espouse, it should be the battling Senator from Wisconsin. But the dead hand of futility seems to rest upon him also. Aside from reminding the country that he was the man who started the Teapot Dome investigation, and damning the Republican party (he really means the Harding Administration) for the loose sense of public responsibility therein revealed, and loudly promising to do what he cannot do, namely, revise the Treaty of Versailles, he said little to the point and diminished, if anything, any impression that might have remained of his being of Presidential caliber. His reference to "the tidal wave of democracy that knows no national boundaries," which is now sweeping the world, was plainly a sop to his Bolshevized New York audience. And his reference was wrong: the thing he misnames "democracy" *does know* national boundaries, for it has discovered itself unable to cross the boundaries reared by the northern white man's Christian civilization. Let the Senator inquire at Moscow (he can do it easily through his supporters) whether this is not true.

In many ways it is a sad spectacle. Here is a Senator whose services have been undoubtedly valuable in many ways, who has wilfully marred his career at several points by lack of judgment, but who at the end of his days has succumbed to his presidential ambition so eagerly as to care nothing at whose hands it was satisfied. A Candidate is known by the Company he Keeps. And Senator LaFollette is in extremely bad company.

We do not agree with General Dawes that Senator LaFollette has any designs against the Constitution. We believe that Senator LaFollette's main contention is against the abuses which are permitted under the Constitution. But there is no doubt whatever that the main body of Senator LaFollette's support would rejoice to see the Constitution of the United States, and all the distinctive institutions of the United States, blown sky high.

Their Trump Card

THE Soviet seizure of Russia is likely to be given a new lease of life, if Grand Duke Cyril can make his czaristic ambitions felt in that unhappy country. A trump card always held in reserve by the alien rulers of Russia has been to induce various royalties to contest for the crown of All the Russias, and in this way divide the Russian people on lines of political preference. "Divide and Rule" is the tactic always employed by these rulers. If the Grand Duke Cyril can be pitted against the Grand Duke Nicholas, and these with their supporters permitted to divide the Russian people into parties and camps, the path of the Soviets will be that much smoother. The whole system employed in Russia has always been to maintain a core of orderly purpose at the heart of the riot.

Investigate

THE minister hammered the desk with his fist and said, "We must teach the people *Peace;* we must teach them that war is *Wrong.*"

"Which people?" the editor asked. "You are just back from Europe—which people? Your own people? Do they need to be taught that war is wrong? But before I say another word to you, tell me this: the general conference of your church passed a resolution which means that those who voted for it will not defend their country in time of war. Do you subscribe to that?"

"Every one of them will defend the country. I fought in the last war. There's a lot of mere talk in this Peace discussion," he said, curiously inconsistent with the vehemence of his former cry for *PEACE.*

"Now," said the editor, "let me ask you another question: do you know whence this cry 'outlaw war' arose?"

"No," said the minister, "but I suppose it came out of the spiritual consciousness of the Christian church."

"It did not come up from the church itself at all," said the editor. "It was injected into the church, and the very words of the slogan given, from outside sources, and those sources anti-Christian. They picked out you fellows as the easiest to fall for sentimental stuff. Get it clearly in your mind—what your great national conferences have been putting over is a program supplied to you from sources that you would despise. I can give you the name of the man who started the whole thing in this country."

"Well, how are we to know these things?" said the minister, with troubled tone.

"Investigate! investigate! Your religious and ministerial organizations are the most easily handled of all. Your church federation is a central distributing agency for a crowd you don't know. You are formed on the plan of swallowing everything, instead of testing everything. 'Try the spirits.' I should say that one of the sanest things every ministerial organization in the country could do would be to appoint one keen member as official challenger and investigator of every bit of propaganda offered you. I'll bet you a necktie you don't even know who supplied the peace proposals which were sent around to you ministers before conference. I'd tell you a few things, but you haven't enough background yet. Go out and look around. Follow these one or two clues I give you. And don't fall so easily next time."

It is good advice for any clergyman. It is good advice for Pastors' Unions. Cut out the propaganda and begin the investigation. The result will be less slush in the pulpit and less bewilderment in the pew.

Fair One Way—Fair the Other

A WESTERN minister is receiving much abuse from paragraphers because he resented having his little daughter told in a public school that she was descended from a monkey. If the little girl had been given the Biblical account of creation, namely that the Lord God formed man out of the dust of the ground, objection would have been made that sectarian religious instruction was being given in a public school. An increasing number of people are beginning to ask why one theory of man's origin is barred from the schools, and another theory pushed to the front on every possible occasion. If school children are fitted to receive one theory, they are fitted to receive both. One has as much "science" back of it as the other has. Incidentally, the statement of the teacher above referred to should warn evolutionists that if school teachers are to be permitted to refer to this subject, they should be better instructed than to make statements which even evolutionists reject.

Village Became a Music Center

FLEMINGTON, NEW JERSEY, is a place with no more than 2,600 inhabitants. But what Flemington has accomplished in the way of making music an integral part of the community is not an ordinary achievement, but something quite out of the common run.

For instance, when Miss Elizabeth Van Fleet Vosseler conceived the idea some twenty-five years ago of gathering together the children of the place to train them thoroughly during the week as choir singers and then having them, when qualified, contribute on Sundays their musical attainments to their respective churches, she really started a movement of encompassing importance to just such a community. Four children constituted her entire group at the start, whereas at the graduating exercises, held recently, 160 surpliced undergraduates, representing five congregations, marched in a body into one of the churches, rendering beautifully some of the finest ecclesiastical music.

Music in Flemington has not only proved a delight in itself but has developed a community spirit that above all else makes for harmony.

The Danger of Headlines

ONE vast injury worked by newspaper headlines is to make the reading public sick of subjects on which they have sought in vain for information. In a series of articles on the Shipping Board published some months ago in THE DEARBORN INDEPENDENT, the name of the Shipping Board was not used in the headlines because it was felt that the very name would drive readers away from what was really valuable information. After people have seen the name Shipping Board in newspaper headlines for five years, and have found no coherent information under it, they simply begin to skip anything pertaining to the Shipping Board. They come to feel that somehow they are victims of a news hoax.

The Housing Problem is a similar matter. THE DEARBORN INDEPENDENT has in possession an article that fairly vibrates with living facts on the Housing Problem which now confronts Ramsay MacDonald, Premier of Great Britain. But will it be wise to mention "housing problem" in the headlines? Have not the newspapers sickened the public of the whole subject? Will not our own readers be driven away from this very valuable article if the term "housing" is used?

It is a problem. Our readers may be interested to watch for that article and see how the headline question is met.

Now It Is Britain

"THE intrusion of Jewry into the affairs of the Empire" is now attracting some attention in Great Britain. In a section of a new book, "Secret Societies," the author, Nesta Webster, deals with "The Real Jewish Peril." In this she finds a cause for the defeat of the Conservative government at the last general election, and the accession to power of the Socialists. She says:

> "The causes of the recent debacle of the Conservative Government are still obscure; but the fact remains that it was precisely at a moment when the Conservative organization had passed largely into Jewish hands that Conservatism met with the most astounding disaster in the whole of its history."

To this *The Patriot*, commenting on the matter, says: "The selection of the first Jewish Secretary of State for India led quickly to disorders on a scale previously unknown, to a greater loss of life than had occurred in all the previous years since the great mutiny, and to a situation now beginning to be realized as fraught with great danger to the Indian peoples and to the Empire."

The influence of the Jewish element in European politics in general is well-known. Russia is an outstanding example of what that influence has accomplished, Germany is in control of the same hand, and now, it would seem, it is Britain.

Norway Sets a Worthy Example

WHAT the government of Norway has just done with regard to putting the welfare of the country above the question of national revenue should be shouted from the housetops as worthy of emulation. In opening parliamentary debate on the subject of liquor and its control Premier Mowinckel announced that the new cabinet intends to stabilize the nation's finances without reliance on any possible revenue from liquor sales and that men will be placed in charge of prohibition enforcement who can be relied on to do their duty.

For once, at least, political changes resulted in bringing about a result that should have far-reaching effect. The previous government, although advocating governmental control of liquor, had expected to realize some 30,000,000 kroner from that traffic. The very fact that the people of the country refused to uphold that cabinet was the best evidence that they preferred to be taxed otherwise than to make liquor revenue the basis for a filled treasury. There is little doubt that Norway will find the money with which to carry on business and the readiness with which a recent loan was absorbed in the United States reflects the confidence of Americans in all things Norwegian.

The present is an instance in governmental activity that speaks volumes for the new order of things when the people work hand in hand with those duly elected to lead them on to better living. Threatened with trade reprisals by wine-producing countries in case it did not admit a certain quantity of their products, Norway, which at first succumbed to this threat, now wisely follows its own course, as evidenced by the action of the new cabinet with Premier Mowinckel at its head.

And Now, Who Spilled the Beans at Lompoc?

Where Heavy Loss and Even Bankruptcy for the Farmer Followed the Application of the Sapiro Plan of Co-operative Marketing

By ROBERT MORGAN

IT HAS been charged by the proponents of the Sapiro Plan of Co-operative Marketing that in these articles the writer has obtained his information exclusively from independent buyers of and dealers in agricultural products, and from farmers who are not members of the associations. It has also been charged that the independent dealers are trying to disrupt and wreck the co-operative associations, and that the non-co-operative farmers know nothing of the operations of the associations.

In the main, these statements are untrue.

The information contained in these articles has been obtained,

First, from the offices of the Sapiro Plan co-operatives themselves, and to some extent from the offices of Sapiro, Levy, Hatfield & Hayes, the headquarters of this particular co-operative movement;

Second, from members of the Sapiro Plan co-operative marketing associations;

Third, from farmers who are not members of any associations; and,

Fourth, from the markets to which the Sapiro Plan co-operatives sell the products of their members.

From the first of these sources, the information obtained has been uniformly misleading, and very little of it capable of being published as the truth. From the second source—the members of the Sapiro Plan co-operative associations—the sad story of failure and loss has come voluntarily and truthfully, because the farmer, though he often deceives himself into *thinking* that he has made a profit, when, as a matter of fact, he has barely made expenses, usually *knows* when he has suffered a loss. The third source—farmers who are not members of any Sapiro Plan association—has been used for comparative purposes, to learn just how independent producers of the same crop fared in their sales as compared with those made by the association for its members. These farmers have not been called on for information on the internal operations of these disastrous associations; that information has been obtained from the associations and their members.

The fourth source of information has been the independent buyers of dried fruits, wheat, hay, potatoes, tobacco, and other agricultural products which the Jewish ring is seeking to control and exploit.

Without exception, these independent buyers, though criticized severely by promoters of the co-operative associations, *are anxious to have the co-operatives succeed.* This statement is paradoxical, but it is true, and back of this attitude of the independent buyers of farm products in this country lie three reasons:

> First, the Sapiro Plan co-operative associations ultimately sell virtually all of their product to the independent buyers, and *seldom, if ever, direct to the consumer.*
>
> Second, the Sapiro Plan co-operatives thus furnish the independent buyers of, and dealers and brokers in, agricultural products, *a machine for the collection of these products, at no cost to the independents.*
>
> Third, in the long run, year after year, *the independent dealer can buy agricultural products of all kinds at a lower price from the Sapiro Plan co-operatives* than he can either from the *farmer* who is not a member of any association, or from *associations operating differently from the Sapiro Plan.*

The second of these reasons is the most important to the independent buyer. Without the Sapiro Plan association, the independent dealer in agricultural products must maintain a costly system of inspection of crops, estimate of their condition and value throughout the growing season, and, finally, bring together these crops at the proper moment to obtain the highest price in the market, so that his own profit may be larger, and so that the farmer may obtain a price sufficiently satisfactory to induce him to sell his crop to the same dealer next year. The Sapiro Plan co-operative association does all these things for the independent dealer, and the sad joke is that, instead of the dealer paying for it, as he used to do, *the farmer member of the Sapiro Plan association pays the bill.* This is something for the farmer to remember when he goes into a Sapiro Plan co-operative association.

If the associations operated under the Sapiro Plan would sell direct to the retailer, or, even better, direct to the consumer—as do the Sun-Maid Raisin Growers and the citrus-fruit association of Southern California—this added charge on the farmer would not be eliminated, but it would be to some extent written off by the simultaneous elimination of the profits of the independent dealer. Likewise, it would eliminate some of the "profits" of the Sapiro Plan co-operative association, and, because it would eliminate these "profits," the Jewish ring refuses to allow its co-operatives to become what they should be—*direct links between the producer and the consumer.*

In Washington and Oregon and Idaho, independent dealers bought wheat from the Sapiro Plan associations at from ten to twenty-three cents a bushel *less* than they paid non-association wheat-growers. In Washington, independent buyers bought Sapiro Plan association hay at 75 cents to $1.50 a ton *less* than they were paying the non-association farmers. Prunes and apricots, dumped on the market by a western Sapiro Plan co-operative fruit association, were bought by dealers at seven to eleven cents *less* a pound than they could buy the same fruits from the producers outside the association. Similar examples could be cited for every agricultural product with whose merchandising the Sapiro scheme has interfered. Small wonder that the much-cursed buyers and dealers and brokers in American agricultural products are hoping that the Sapiro Plan co-operatives will continue to flourish!

One of the most flagrant instances of disaster brought to the farmer by a Sapiro Plan co-operative marketing association occurred in the Lompoc Valley, in California. There are about 12,000 acres of arable land in this valley, surrounding the city of Lompoc, and some 3,000 acres more tributary to it in smaller valleys in the hills. It lies in Santa Barbara County, rather more than 300 miles south of San Francisco. On the average, eighty per cent of these 15,000 acres are planted to beans of several varieties. The bean crop of this valley for the past seven years is of interest, because quantity of production has a direct bearing on the operation of the Sapiro Plan co-operative association. In 1917, Lompoc Valley produced 29,091,100 pounds; 1918, the record year, 34,908,000; 1919 showed 23,416,400; while 1920 fell to the lowest of any of the seven, due to the disastrous activities of the Sapiro Plan association in the two preceding crops, with only 9,585,800 pounds. In 1921, the crop was 131,500 bags of 100 pounds each, or 13,150,000 pounds. The following year, 1922, produced 17,026,500 pounds of beans in the valley, and last year, the crop dropped off to 13,597,000 pounds, largely due to drought. This year's crop has not been closely estimated.

The production of beans in the entire state of California for the four years in which the Sapiro Plan co-operative was active in the Lompoc Valley was as follows, the amounts being in pounds: 1918, 487,587,000; 1919, 298,775,000; 1920, 171,000,000; and in 1921, 337,500,000.

While the Sapiro Plan co-operative association has now been virtually eliminated in the Lompoc Valley, where it had a fair field and a non-perishable crop with which to demonstrate its real worth, it is still operating in the Sacramento Valley and in the large bean-producing territory around Ventura, California. Members are dropping away rapidly in the Ventura district, and there is great dissatisfaction with the results achieved in the Sacramento Valley. From all indications it is merely a question of time until the whole California Bean Growers' Association, as this Sapiro organization is called, will go the way of its Lompoc local branch, whose history is told herein.

The California Bean Growers' Association was formed in the autumn of 1918. There was no occasion for the organization of this association, because the growers had received twelve to thirteen cents a pound, a record price, for their 1917 crop; there was an open market seeking beans in 1918, and the crop in the Lompoc Valley, to which this article applies exclusively, was the largest yet grown there. But, with the assistance of William Cooper, N. D. Hall, Lawrence Smith, and H. M. Hawkins, who afterward became manager of the Lompoc district, Aaron Sapiro was brought into the valley. Behind him came the usual squad of "dynamite boys," previously described in these pages. They rushed the farmers into membership and succeeded in obtaining, in the Lompoc district alone, 200 bean farmers as members of the organization. These represented approximately ninety per cent of the bean-growers of the valley, producing a trifle more than ninety per cent of the crop in that territory.

> Of these 200 who made deliveries of their 1918 crop to the Lompoc district of the California Bean Growers' Association, only five made deliveries of their 1923 crop to the same organization, and, as far as the writer has been able to learn, only two will make such deliveries of their 1924 crop. Ten members of the Lompoc district were prosperous farmers when they went into the association; today they are bankrupts and have left the valley. Sixteen others who either owned or leased farms when they went into the association are today working for wages, having lost their leases and their titles to the land they occupied, and are endeavoring as honest men to pay off the debts piled on them by the association. Thirty-five others were able to sustain their losses, but refused to deliver their beans to the association in 1921. The remainder, with the exception of the five noted, made no deliveries to the association in 1923, and all the bean-growers of the valley, with the exception of the five, are selling their product to the independent buyers.

Incidentally, the California Bean Growers' Association, whose headquarters are in San Francisco, *is suing some twenty farmers in this valley* in an effort to collect a cent a pound on these farmers' bean crops, which they sold outside the association to get money on which to live and pay their debts. As one of these defendant farmers said to me:

"These suits make me wonder whether this association belongs or ever did belong to us farmers, or whether it belongs to an outside gang of exploiters, who came in here to make money out of us."

So far in this investigation, the writer has failed to find a single Sapiro Plan co-operative marketing association which actually belongs to or is controlled or directed by the farmers who make up its membership. The "outside gang" theory held by the farmer who is being sued for money paid to him for a crop which he

The town of Lompoc, and the heart of the Lompoc Valley, where 200 bean growers lost $1,750,000 in three years, due to the operations of a Sapiro Plan co-operative marketing association.

The Premier of France—Edouard Herriot

Frugal and Essentially a Man of the People; Ardent Connoisseur and Lover of Rare Books

By ANNE LEE and MARGUERITE SCHULZ

THE visitor to Paris who hopes for a fleeting glimpse of M. Edouard Herriot, whose successful rise to the dizzy heights of the Premiership of the Republic recently astounded the world, would probably be inclined to lurk about the vicinity of the Quai D'Orsay or perhaps his residence. Very likely, not one would expect to find the gentleman calmly browsing over a first edition in an out-of-the-way bookstall, yet that is exactly where he is most apt to be found during his leisure moments.

In a tiny shop nestled in one corner of a rather dingy building in the Place Loban, not far from the Hotel de Ville, we found the statesman shortly after he became premier. In the atmosphere of books—books new, old, common and rare—it was not difficult to approach him and renew acquaintances (since we had had the pleasure of meeting the Premier during his American tour last autumn). About his snappy, black eyes, there was the expression of the guilty schoolboy whose teacher has just discovered that, instead of studying his geography, the pupil is reading a detective story concealed inside the textbook, and when we took occasion to recall another similar incident which occurred in New York City, the Premier laughed heartily and admitted his weakness amounted to an obsession.

M. Herriot as a lover and connoisseur of books possesses an interesting collection of first editions as well as old and rare volumes of various kinds. The incident alluded to which occurred during his brief stay in New York was this: One day he became separated from the rest of the party and when, after a few hours, the principal member of the expedition failed to put in his appearance, his secretary decided that a bookstore was probably the cause of the disturbance. He recalled someone having pointed out Brentano's to M. Herriot and it was there that the astute secretary found his employer in a most enthusiastic frame of mind over a lucky discovery which was at that moment being wrapped up.

Unlike most Frenchmen, M. Herriot is a man of large stature. He is more than six feet in height and weighs considerably in excess of two hundred pounds. In bearing, he gives one the impression of importance, but it requires only a glance at the kindly face to recognize the true personality of the man. Generous and big-hearted he is, and about the large eyes there is an expression of unmistakable compassion, whereas the square-set jaws betoken the will power and fighting proclivities of the tenacious statesman.

Of Humble Origin

IN MANNERISMS he is typically a product of France, being effusive and demonstrative, and gesticulating with his hands a great deal while he talks. He likes to get away from politics, and his brief visits to the bookshops are like carefree recesses in days that are crowded with affairs of state. After graciously bowing in acknowledgment of our congratulations, the Premier made it clear that he considered political conversation taboo and almost sacrilegious in the presence of his beloved books.

Herriot's heavy head of dark, curly hair defies the rule of brush or comb. The Mayor of Lyons is careless about his appearance, and, in a state of absent-mindedness, he is apt to go outdoors without his hat or without his cravat if he is not watched. During his American tour, it required the watchful eyes of both his secretary and the friend who accompanied him to see to it that he was properly garbed. The question of clothes is a matter of little concern to the leader of the Left.

Born at Troyes in 1872, of humble parents, M. Herriot has never known affluence. He is by no means a man of wealth today, and the possession of wealth holds no appeal for him. Having been orphaned at an early age, it was through steadfast, diligent work at school that he won recognition for his keen intellect. At fifteen he was awarded a scholarship to the College of Sainte-Barbe, Paris, and later he received the distinction of being appointed to the Ecole Normale Superieure, Paris, where only a limited number of the highest-ranking honor pupils are sent to be trained as university professors.

From there he went to the University of Lyons to teach, and it was as a professor that this dominant leader first acquired his enviable reputation as an eloquent speaker who "always talks on his feet," as the French refer to an extemporaneous speaker. Although his public utterances are inclined to be flowery and moving as well as fluent, M. Herriot is not much given to small talk.

He is in reality a very unpretentious, simple, home-loving man; a very fatherly type, although he has no children of his own. In Lyons he is loved by young and old, and no matter how preoccupied he is with affairs of state, it is his custom to stop along the streets and talk to a group of children; pat some little fellow on the head or lift a rosy-cheeked little girl to his six-foot height and kiss her on the cheeks before he resumes his journey.

Ever since he went there to teach, Herriot has made his home in Lyons. His wife was the daughter of a Lyons manufacturer. He has done more than anyone else toward bringing this thriving city in the south of France, located in the center of the silk industry, to the attention of the world, and, indeed, of Paris as well; and, by way of appreciation, Lyons has elected her favorite son mayor for twelve successive terms.

"Father of Rehabilitation"

IN 1916, Herriot was a member of the French Cabinet as Minister of Public Works. Later, he served as Senator, but resigned his seat to run for office in the French Chamber of Deputies, and in 1921 he was elected deputy from the Department of the Rhone, the district in which Lyons is situated.

The same hard work and powerful vitality which characterized him in his early years at school have marked M. Herriot's political efforts. He works hard because he enjoys work, and he has a seemingly never-ending store of energy and ambition. He is always on the move and never seems to tire of being so. His friends marvel at the apparent ease with which he constantly travels back and forth between Paris and Lyons.

Even the rigors of his American tour, with a program crowded to capacity with banquets, lectures, entertainments, and the like, interspersed with continual train connections and travels, failed to test the strength of M. Herriot. He was the only member of his party who withstood the strain of the hurried tour, and he seemed to enjoy it all immensely.

It is not generally known that Premier Herriot is considered the "father of rehabilitation" in France. During the war, he started the first school for the rehabilitation of French soldiers. The school was situated in Lyons and called "L'Ecole Joffre" after the beloved French soldier. It was from this school, where Herriot's own ideas were worked out, that the American Red Cross got its inspiration for rehabilitation work in America.

"L'Ecole Joffre" served as a model for several schools later established throughout France, and it was largely due to the inspiration of the work conducted there that the American Red Cross founded its own rehabilitation program. It was this rehabilitation department of the Red Cross, which later became known as the Institute for Crippled and Disabled Men, from which the government's rehabilitation work was afterward copied.

The Institute for Crippled and Disabled Men is still carrying on its work at Twenty-third street and Lexington avenue, New York, and his visit to the school last autumn was considered by M. Herriot one of the outstanding features of his American tour. Even away off in the Paris bookshop where we met the now-famous Premier, he spoke of his sincere interest in rehabilitation work.

Although he understands and reads English perfectly, M. Herriot is very timid about carrying on a conversation in our language, and, inasmuch as our French was considerably more imperfect than the statesman's English, a prolonged conversation was impossible. Bowing graciously over our hands, the Premier was most solicitous as we made our adieus, and we had reason to feel that our casual visit to the little bookshop had indeed been worth while.

The Taxgatherers Abroad

By R. L. OUTHWAITE

IN THE British House of Lords recently, some of our great capitalists pronounced the impending doom of British industry at the hands of the taxgatherer. Outside these august ranks the argument was reinforced by "captains of industry" such as W. L. Hichens, chairman of the great engineering firm of Cammell, Laird and Company, who declared: "Trade is bad, and there is every likelihood of its getting worse."

As like results derive from like causes, and as bad trade in Britain denotes bad trade elsewhere, its root cause in Britain conveys lessons for others than her own people. The determining factor is taxation levied upon industry. Estimates of the taxation per head in various countries generally tell less than the truth for they omit subsidiary state or municipal taxation from the account. In Britain this is particularly the case. It has become the custom of governments to enforce schemes of national, as distinct from local, concern and leave their administration to the local governments, the boroughs and county councils. The cost in part is also cast on these authorities, who are left to raise the revenue by way of rates.

How Rates Are Leviea

THESE rates are levied upon the rental value of land and buildings within each rating area assessed on rent actually received. When the land lies vacant, no rates are payable though its value may be enormous. When a dwelling is not occupied it is not rated. The rates, therefore, fall as a penalty upon the use of land, and operate as a discouragement to enterprise. It is on taxpayers so mulcted that governments have cast a great share of the provision of funds for such services as education, relief of the poor, the cost of health legislation, and on whom it is now proposed to throw, in part, the responsibility for the provision of houses which over a term of years is estimated to cost upward of two thousand million pounds (£2,000,000,000).

So it will be seen that when the taxation of Britain is set down at approximately £800,000,000, this does not tell the whole tale. When municipal taxation is taken into account the sum total would not be far short of a round £1,000,000,000 a year. Nor does this tell the whole story. As the industrial centers of Britain are those where the burden of education and poor relief is heaviest it is there that rates are highest. Where the rich live the burden of these services is the least and rates are the lowest. What these imposts mean in relation to industrial enterprise and the condition of the workers may be gauged from the case of Sheffield, the great engineering center of England. The following news item was recently circulated:

"About 32,000 people in Sheffield have not paid the rates in the latter half of 1923, and summonses have been issued against most of them. Another 10,000 people, who have only paid a portion of the rates, are paying the balance in weekly installments. There are 30,000 unemployed in Sheffield and the Poor Law Guardians are in debt to the extent of a million pounds (£1,000,000)."

This brief paragraph is an epitome of the plight of the workers in those "devastated areas" of Britain that war has ruined through the destruction of trade, and that taxation is keeping in the dust and ashes of former greatness.

An examination as to the incident of the rates shows that one-third of the assessable value of Sheffield is furnished by the cottages of the workers of a less ratable value than fifteen pounds a year. Which is to say that the occupant of such a cottage, subsisting in many cases on the unemployment dole, and supplemented by poor relief, pays seven pounds ten shillings a year to the poor rate (ten shillings in the pound) alone and in total rates (twenty-two shillings in the pound) sixteen pounds ten shillings. Such is the burden cast upon the citizen in addition to national taxation which is set down at fifteen pounds eighteen shillings a head.

Labor Government's Impotence

WHEN it is realized that £1,000,000,000 a year is taken from the people in national and local taxation it can be understood how profound a bearing taxation has on trade which Mr. Hichens tells us "is bad and likely to continue bad." It signifies a vast reduction in the consuming capacity of the masses, which means a lessened demand for goods, a lessened demand for workers to produce goods, a constant widening of the area of unemployment, further reduction in consumption—all of which makes for "bad trade."

Furthermore the local taxation as levied penalizes all enterprise and in one district where the rates are higher than in Sheffield the head of a great local engineering works has complained that the rates alone equal a dividend of five and one-fourth per cent on the company's ordinary shares.

The great Pitt once declared in relation to indirect taxation, "There is a means by which you can tax the last rag from a man's back and the last bite from his lips without causing a murmur. The grumbling will be against hard times. The people have yet to learn that hard times are caused by taxation."

That fact the peoples of all nations have yet to learn and apply the remedy.

In Britain there is a Labor government which secured its votes at the last election mainly on two pledges:

(1) That the Labor party alone had a "positive remedy" for unemployment.
(2) That by way of a capital levy it would raise £3,000,000,000 to reduce the national debt.

The Labor government has already acknowledged its impotence to solve the problem of unemployment and has estimated the permanent number of the unemployed at 800,000. At the same time it has scrapped the capital levy. The reason is probably to be found in a statement made by Ramsay MacDonald in which he stated that the service of our debt to America compelled the government to walk warily.

And Now, Who Spilled the Beans at Lompoc?

Concluded from page 9

produced, owned and sold, is as true of other Sapiro Plan co-operative marketing associations as it is of the Lompoc district branch of the California Bean Growers' Association.

The Lompoc Valley produces as the main part of its crop small white (navy) beans and "pinks." As has been said, the growers received *twelve to thirteen cents a pound for their 1917 crop.* For the 1918 crop, the independent buyers and brokers offered *ten to ten and one-half to eleven cents* a pound. The promoters of the Sapiro Plan association promised the farmers who joined a minimum of twelve cents a pound. As a matter of fact, the 1918 crop netted the growers in the association from *five to eight cents a pound,* as compared with *the ten to eleven cents which the growers outside the association received from the independent buyers.* Some of the growers in the association received as low as three and one-quarter cents a pound for their beans, while a few sacks were sold at eight cents. The great majority of the crop was given "orderly marketing" by the Sapiro Plan association in such a clever way that they netted five and one-half to six cents a pound to the farmer. The beans grown by the members of the association were identical in quality and kind with those grown by the independent outside farmer, yet the latter received in some instances *twice as much,* and in all instances at least *forty per cent more* than the association member.

The California Bean Growers' Association never has deigned to explain this loss to the farmers of the Lompoc Valley, but the whole deal looked so bad that Herman Steen, recorder of the "successes" of the Sapiro Plan, offers this palliative, in his book, "Co-operative Marketing":

> "Before the association had an opportunity to sell many of its beans, the Oriental beans crashed the market from ten cents a pound to less than five. Right there, the manager blundered badly; *he decided to hold for a price fixed as a fair return.* He sat down on the 1,300,000 bags of beans and waited and waited for the price that never came. There was no good reason to expect any material advance over the five-cent level, but the 1,300,000 bags were held for sixteen months, during which only a few were sold. Then a change in management occurred, and the stored beans, to which had been added the 1919 crop, were slowly merchandised at the best available prices. The holding policy of the California Bean Growers' Association was probably the worst blunder in merchandising ever committed by a co-operative marketing association."

The italics in the above quotation are my own, and the whole bad affair bears out my statement, repeated frequently in these articles, that one of the greatest factors of disaster in the Sapiro Plan is the policy of price-fixing.

Suits Against Members

THE Lompoc district was organized for three years, with the regulation Sapiro Plan contracts, depriving the producer of all control over his product, written for that period. Though these contracts involved the 1918 crop, they technically covered the 1919, 1920 and 1921 crop also, and the interpretation of them as governing the disposal of the 1921 crop is one of the features of the suits the association is now bringing against its own members. Agents of the association—presumably with the approval of the headquarters in San Francisco and of the "supervising legal counsel," Mr. Aaron Sapiro, also of San Francisco—attempted to enforce these contracts in 1922, but failed signally.

In common with the investigations of other Sapiro Plan co-operative associations, the writer called on and had correspondence with more than forty members of the Lompoc Valley branch of this association. Here are a few brief histories of the disasters this association brought to bona fide farmers of that district:

One large bean-grower sold his 1918 bean crop to the independent buyers for ten cents. He was persuaded to join the association in the autumn of 1918, and the association collected from him one-half cent a pound, or fifty cents a bag on the crop he already had sold, *as a "merchandising fee,"* though the association had no more to do with merchandising those beans than did the writer. This man's bean crop brought him in $10,000, paid to him on the day that he sold the beans to the independent buyer. He did not need money to carry him over the next year's (1919) crop, yet he had to pay what was equivalent to interest on a loan—called an "advance" by the Sapiro Plan promoters—which he never obtained or used.

Another man had his 1918 crop sold to an independent buyer at ten cents, but had not signed a contract. A gang of association agents got hold of this grower and "persuaded" him to join the organization. He received three cents a pound for his beans.

A grower who had 1,500 sacks, or 150,000 pounds, worth at a low price $13,000, had in the lot 100 sacks which were below grade. He was informed by the association "experts" that all his beans would have to be hand-picked. Without consulting him further, these beans were shipped to Michigan, supposedly to be so hand-picked. *The only return this man ever received for his beans was a bill for $600 charges for hand-picking,* and this he had to pay and did pay. He never has been able to learn what became of his beans, why they were not sold at a profit, and why he could not get a statement.

The bank which had been carrying the two last-mentioned growers from year to year, was compelled to foreclose its mortgages, and both lost their farms. This, however, is not unusual among the victims of these Sapiro Plan associations.

Another man, at one time a director in the association, sold his crop for $80,000 less than he was offered for it by independent buyers. A Japanese grower, with 350,000 pounds, received three and one-quarter cents a pound from the association, after he had been offered six cents by the independent buyers. That is to say, he got $11,375 for a crop for which he could have obtained $21,000. More than this, he, like other members of the Sapiro Plan co-operatives, waited from six months to a year to get his reduced payment, when he could have had the larger sum immediately on delivery of the beans.

Four other men, producing from 3,000 to 5,000 bags each, were compelled to sell their farms to get money to pay their debts. All four are now working as foremen on other farms in an effort to clear themselves of still other debts into which they were plunged by the "price-fixing" and "orderly marketing" methods of this Sapiro Plan association.

Still another, one of the most prosperous and successful farmers of the Lompoc Valley, with a farm conservatively valued at $100,000, sold his 1919 crop of beans to outside buyers while he was a member of the association, and was compelled to pay approximately $15,000 into the association for doing so.

Still another had 900 sacks or 90,000 pounds of beans. Needing money to meet his bank loans, he asked the association to sell his beans immediately. The association officials curtly informed him that he had nothing to say about the time when his beans were sold, or the price at which they were disposed of. He, therefore, sold the beans to an outside buyer for six cents a pound, receiving $5,400 in cash immediately. The association is now suing him for $1,600 penalty for selling his own product when and to whom he chose.

As matters stand—though this man is fighting the suit—he can afford to pay the $1,600 and still have more for his beans than the association paid other members at the same time, when the net return to the grower in the association was two and three-quarters to three cents a pound. Had he sold through the association at three cents, he would have received $2,700, or just half the amount he did get from the outside buyer, and, if he pays the $1,600 demanded by the association, he still will be $1,100 to the good.

Another man, who was out of debt, had money in the bank, and owned 300,000 pounds of beans when he went into the association. Outside buyers offered him six to seven cents cash a pound. The association actually paid him, after some eight months, 3.28 cents a pound. He is today $20,000 in debt, has mortgaged his crops for the next two years to banks, with the endorsements of the independent buyers who are trying to save him from bankruptcy, and does not expect to get out of debt for five years.

These are fair examples of just what the Sapiro Plan of Co-operative Marketing does for the American farmer. There are scores of others among the 200 bean-growers of the little Lompoc Valley. There are a few, just a beginning of the day of doom, among the bean-growers at Ventura and in the Sacramento Valley, where the California Bean Growers' Association is still operating. Time is all that is required to bring heavy loss, often bankruptcy, to the farmer who allows a Sapiro Plan co-operative association to get his name on the dotted line. The California association has as its members approximately eighty per cent of the bean-growers of California, with the exception of the lima-bean growers, who have their own association, and the Lompoc farmers, who have learned their lesson, and are now paying the teacher.

A cloud of mystery covers the operations of this Lompoc branch of the California Bean Growers' Association. No one knows, least of all the members of the defunct branch, what became of either beans or money. The writer rather doubts whether the one-time officials of this branch know what became of them. Of all the members whom the writer interviewed, not one ever saw a report of the operations or expenditures or income of the office at Lompoc. The best corner office in the town was rented, lavishly fitted up, and provided with a large force of clerks, bookkeepers, assistant managers, salesmen, bean experts, and the like. The consent of the farmer-members, who were supposed to own, control and direct the association, was never asked for these expenditures, nor were they ever informed as to what their association was costing them. The Lompoc branch had no warehouse of its own—though the state association has a large and costly one at Pittsburgh, about as far from the bean production centers as it could be placed—and the beans belonging to the association members were stored in private warehouses at Lompoc. There, in spite of the large clerical force kept at the Lompoc branch headquarters, the owners of these warehouses had to do all the bookkeeping and clerical work on the taking in and shipping out of the millions of pounds of beans from the 1918, 1919 and 1920 crops. The warehousemen claim, apparently truthfully, that they never received any pay for this work. What then was the staff of the Lompoc branch doing to earn the thousands of dollars of the farmers' money paid to it?

Look at the Figures

IN ADDITION to this waste, the Lompoc branch never had a competent selling organization; its members were not allowed to say when, to whom or at what price their beans should be sold; the producer had no voice in the control of expenditures or the direction of operations, and, finally, the Lompoc branch was compelled, through the incompetence of its sales force, to dispose of a great part of its product to the independent buyers, who thereby obtained the bean crop, all collected and prepared for them, at approximately one-half the price they would have had to pay, and are paying today, to the grower outside the association. But the inner workings of this branch association, who got the money, how he got it, or where and how it was wasted, as the case may be, probably never will be told.

And, if anyone doubts that those 200 members of the Lompoc branch of the California Bean Growers' Association did suffer heavy loss, let him look at these figures:

The years of 1918, 1919 and 1920 were those in which the association had the Lompoc Valley bean-growers under control. The total bean crop in this valley for those three years was 679,102 bags of 100 pounds each. Of this crop, the association handled ninety per cent, or 611,192 bags. In those years, the independent growers received an immediate cash price for their beans of seven to eleven cents a pound; the growers in the association received from 2.75 to 8 cents a pound. The average of the independent prices was 9 cents; that of the association 5.375 cents. The association then brought into the Lompoc Valley and distributed among its members $3,285,157, when the same amount of beans, sold independently, would have brought $5,490,728, to the same number of men in the same valley. This is a dead loss of more than $2,000,000, sustained by 200 men in three years.

The majority of the bean-growers in the Lompoc Valley, no matter how great their losses, have charged them off and gone to work to try to retrieve their fallen fortunes. They do not seem to be particularly "put out" with the directors of the association—in fact, some of these directors still live in Lompoc—and *the majority of the losers believe that the fault was in the system, in the Sapiro Plan,* and not in the men who tried to administer it. The writer does not entirely agree with these bean-growers, but that is neither here nor there. Out of the disaster which the Sapiro Plan brought to Lompoc has grown one very valuable result, that no promoter of private schemes for mulcting the farmer, or for any co-operative trap, ever will get another hearing in Lompoc.

The First Oil Well

By JOHN KAISER

THE gigantic growth and development of the oil industry serves to call attention to the small beginnings of that industry. Ohio has played a prominent part in this growth, and it may be of interest to know that Southeastern Ohio was the first to attract attention.

Petroleum was first found in Ohio, and perhaps in the world, in what is now Noble County, within one mile of Caldwell, the county seat. Noble County was the last county to be formed in Ohio.

The first well was drilled in 1814 by Robert McKee, who, in 1796, came to Marietta from McKees Rocks, Pennsylvania, in a flatboat. The well was drilled for salt brine, and the work was done in rather primitive manner, a spring pole being used, and the tools allowed to drop down into the hole when the pole was released.

When oil was struck they did not know what it was and so covered up the well and abandoned it. A hollow sycamore log did service as casing and it may be seen today in good condition, still casing the well.

First oil well, drilled at Caldwell, Ohio, in 1814.
Mr. and Mrs. Chris McKee standing at the well.

A nephew, Chris McKee, lives at Belle Valley, not far from the well, and serves to keep alive the traditions of the family.

Chris McKee has been engaged in the oil business for many years, but before he turned to the oil business he made two trips to the western country in search of gold.

His first trip was in 1862 and for more than three years he prospected in Idaho and returned with a neat sum of money. Again the lure of gold took him to the West, and, in 1877, he went to Deadwood, South Dakota. He was obliged to travel by stage the last 350 miles from Cheyenne to Deadwood.

He saw Red Cloud after the famous battle known as Custer's Massacre. He also got to see Spotted Tail, Sitting Bull, and other noted Indian chiefs. He says that Sitting Bull was not very pleasant looking, but he is quite complimentary of the others.

Mr. McKee has been extensively engaged in the coal business, and was one of the builders of the railway from Marietta to Caldwell.

Oil first went by the name of Seneca oil. Peddlers used to gather the oil by soaking blankets in springs where it was found, wringing out the oil, and then traveling over the country on horseback, selling it to farmers' wives for rheumatism, sprains and bruises.

From such use it has developed until it enters into the manufacture of about all products used in shop or home.

Vermont and Its Beautiful Marble

Green Mountain State Supplies Material Solomon Might Have Envied

By F. N. HOLLINGSWORTH

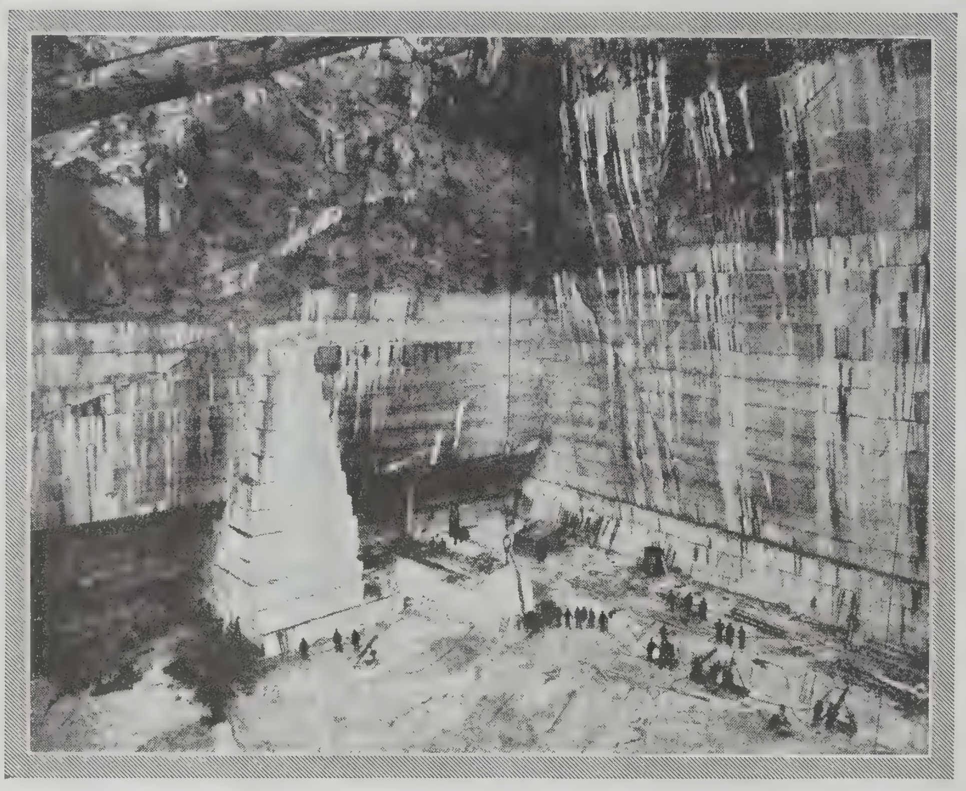
MARBLE is as old as the oldest history. In fact some of the earliest history ever written was inscribed on marble tablets. Among the ancient marbles collected at Oxford, England, is one example, known as the Parian Chronicle, supposed to have been made on the island of Paros. Inscribed upon it are some of the great events of Grecian history, going back to the reign of the first king of Athens, 1582 B. C., and covering a period of 1,300 years.

In Bible times marble was regarded as a choice product. Numerous references to it may be found in the Bible, and for the famous city of Babylon, the palaces of the kings of Persia and the Temple of Solomon, it was regarded as a precious stone. If Solomon could only have had access to the marbles of Vermont, the glories of his temple would have been manyfold greater. For Vermont has at least fifty grades and varieties of marble, all of great beauty; and a supply that is almost inexhaustible. In fact, only a comparatively few deposits have yet been touched. Underlying practically the whole of the Green Mountain range are believed to lie other great beds, and possibly varieties of even greater beauty than those now quarried, if that is possible.

Marble quarrying is one of the basic industries of the state, dating back to 1785, when the first quarry was opened at Dorset, and no one seems to know just when Vermont marble became a salable product. Some time before the Revolution blocks of it were being cut and hauled around in oxcarts to the farmhouses for fireplace stones. Vermonters had learned that it stood the heat without cracking and they liked its bright, glistening surface. And so Vermont marble made its debut in the form of fire slabs; then it began to be used for tablets and markers in the cemeteries. Here again dates are lacking, but in the old church burying ground at Bennington is a little slab split apparently from the neighboring ledges and set in place in 1759. Within this same inclosure are many more marble slabs erected between 1770 and 1780, and up and down the hills and in the valleys are countless other cemeteries with records fully as old. Jonas Stewart was a pioneer in this tombstone industry.

For nearly a hundred years many different men tried in vain to place the Vermont marble industry on a stable and paying basis, but something always seemed to stand in the way—chiefly lack of facilities for quarrying and working it and then for shipment of the finished product.

The first real advance came about forty years ago, and under the guidance of able, farsighted business men, chief among whom was the late Senator Redfield Proctor, the business fought its way to an era of prosperity. It was through Proctor that the industry received its great development. Gradually, but with unalterable determination, he pushed Vermont marble out over the country. At that time there was only one quarry in operation, and all the blocks were hauled to the mills by ox teams, a few scattered houses standing where the town of Proctor now stands. Today the site of that old mill is marked by a huge group of modern structures, and the business is now the largest marble manufacturing district in the world. The one quarry has increased to seventy-five or more, with a combined yearly output of 1,000,000 cubic feet. There are shops and mills in Proctor 1,500 feet long, with other plants at Center Rutland, West Rutland, Florence, Brandon, and eight other points, besides one just over the line in New York State.



The Sutherland Falls quarry, in many respects the most wonderful quarry in the world. The depth may be gauged by the comparative size of the men at work on the floor of the quarry. More than 1,000,000 cubic feet of marble are produced annually in the Vermont quarries and shipped all over the world.

This incline is much steeper than the picture would indicate. A three-rail track, on which loaded cars pass up and down, one coming down with marble while one goes up with supplies. They automatically take sidings to pass each other at regular points. Thus a three-rail track is sufficient.

Marble from the Green Mountain State is being shipped over the whole world, and some of America's greatest memorials, notably the Arlington Memorial at Washington, which cost $1,000.000, are constructed of this beautiful stone, which, in Vermont, seems to be of never-ending variety. It seems almost unbelievable that one small state could produce so many wondrously blended varieties. No two of them are alike and each has an individuality of its own. The delicate markings and shades of color are arranged by Nature in manifold combinations.

One company alone in the state employs more than 4,000 men. This one concern has twenty-seven acres of shop and mill space, and more than fifty traveling salesmen are kept busy securing orders, from the front and interior of a magnificent bank building or great city memorial, down to simple tablets and tombstones later cut by some local monument dealer.

At West Rutland there are no less than a dozen hillside quarries, with a maximum depth of more than 300 feet. As a result of tunneling operations, all these openings have been merged into one, with an underground floor space of seventeen acres—as big as a city park. There is a lime plant, too, at West Rutland, of concrete and steel, equipped with crushers that will reduce marble blocks to pieces no larger than walnuts, and supplementing these is a gas-heated rotary kiln, 125 feet long and 8 feet in diameter which turns marble refuse into lime at the rate of 75 tons a day, under a temperature of around 2,000 degrees Fahrenheit. This is an important by-product.

In the town of Proctor we find an aerial tramway which extends for two and a quarter miles up the mountain, connecting the shops and mills with an unfailing supply of sand. Sand is necessary for the polishing of the marble, and a bucket weighing 300 pounds, carrying a quarter ton of sand in one load, moves along this cable every forty seconds. In ten years approximately 1,500,000 tons of sand have passed in and out of these buckets to the polishing mills, and a deposit of sand covering seventeen acres has been lowered sixty feet.

Stretching from the highest quarry on Danby Mountain to the track of the Rutland Railroad, 900 feet below, is a mile of cable railroad.

People who have never visited a modern quarry have but little conception of the huge scale on which everything is handled. To begin with, the industry uses some 10,000 horsepower on a circuit extending from Huntington Falls to Manchester. One plant has a score of turning lathes, one of which will turn a column 32 feet long; more than 100 rubbing beds for rubbing down the surface of the marble; some 300 big pneumatic tools and more than 400 gang saws running day and night. The yearly output is 21,000 blocks, and by blocks is not meant those of cobblestone size. The average weight of a quarry block is fifteen tons and the largest block ever quarried was sixty-three tons. There are traveling cranes to lift these, carrying up to fifty tons.

Those who have a taste for mathematics can do some nice little sums in arithmetic by juggling the above figures. A flat car, for example, runs somewhere about forty feet in length, and can take two of these fifteen-ton blocks handily. How many flat cars would be required to take them all at one time, and how long would the train be? Go further, if you like, and figure the number of locomotives required to haul the train, and the amount of horsepower. What a chance for the mathematical shark! And more than that, 6,500,000 square feet of lumber are used every year to box the marble product and for building purposes. Something like a quarter of a million monuments and tombstones are shipped out of this little Vermont district in a year, to all parts of the world.

One company uses 250 quarrying machines and 107 polishing machines day and night, the quarries being lighted by electricity. There are carborundum machines, planers, channelers, drills—in fact a machine wherever a machine can be used. Far different from the old methods when it was a work of days to get out one block that could be hauled by a team of oxen to the little mill where it was chipped, smoothed and polished by hand.

On a Vermont farm stands a slab of marble that marks the grave of a Continental officer who died while returning from a Canadian expedition. In respect to his memory a tombstone was wedged apart from one of the nearby marble ledges and hammered into form. Rough and crude, perhaps, but it shows the enduring qualities of Vermont marble when exposed to the elements, as this has been, since it was erected in 1776. Then we turn to the Arlington Memorial—the largest cemetery monument in the world, and the costliest—a masterpiece of designing and a fitting memorial. While the one was made by untrained hands, the latter was produced by faultless workmanship; but both will still endure for centuries to come.

The Arlington Memorial, by the way, built entirely of Vermont marble, is the largest structure built wholly of marble in the world. It is 260 feet long and 236 feet wide, covering 60,000 square feet of space and having seats inside the colonnade for 5,000 persons. About 450 carloads were quarried and finished for this work.

Marble is quarried first by the use of a channeling machine, which runs on a movable track along the floor of the quarry. The underground quarries at West Rutland are 2,000 feet long and 700 feet wide, with an electric road which operates on the floor 300 feet below the surface, and stretching for 800 feet out into the tunnel. Connecting with this railway, and leading up to the ground level is a cable track 500 feet long, rising at an angle of 45 degrees.

The channeling machine, by continual pounding on

Looking down into a section of the West Rutland quarry. Depth from 200 feet on the front edge to 300 at the back. The floor space at the bottom is 2,000 feet long, extending 400 feet under the hill.

the marble, sinks a narrow groove several feet deep, making it possible to take out blocks of a uniform size. The cutting by the channeling machine is done with five chisel-pointed drills, clamped together in a row and attached to the end of a steel bar.

After the quarry block has been drilled and wedged at the bottom, it is tipped down in such a way that a giant chain can be slung around it and it is hoisted by means of a derrick, placed hundreds of feet above.

The modern marble mill is constructed of steel and is divided into stalls or compartments, any one of which will accommodate a fifteen-ton quarry block. The sawing is done by smooth iron bands, set in a moving horizontal frame, acting in conjunction with sand and water. While the soft strips of iron are dragged to and fro across the marble, water is pouring down over the top, bringing the particles of sand which serve as teeth for the saws.

Next comes the rubbing bed, a large, horizontal cast-iron disk, made to revolve in a frame and so constructed as to allow sand and water to play over its surface. After the blocks have been reduced to the required size, they are placed on the rubbing beds, where they are held in a fixed position until the surface and corners are smooth.

Polishing is all done by a small, whirling disk, which is moved about over the watered surface of the stone. The first plate used is coated with carborundum, the second with aloxite and the third with hone. To complete the process, the plate is covered with felt and applied with polishing putty smeared over it.

Diamonds are harder than marble, and they are used in sawing it. When the pieces are too large, embedded in a steel disk are 125 of them, and a saw of this kind, if given plenty of water, will cut its way through the hardest marb'e. By far the greater part of the ornamental work on tombstones and the cornice work for buildings, and so forth, is produced by means of pneumatic tools. These chisels, driven by compressed air, do a tremendous amount of work in a short time, and enable the marble workers to get out the ornamental work for great structures in a tenth the time that would be required for hand chisel and mallet.

To keep up with the steady demand and to be prepared for any big contract that may come in unexpectedly, the quarries have to keep a large amount of the quarried blocks on hand. One such pile contains 22,000 blocks constantly. The industry is growing rapidly from year to year and is adding great wealth to the state. More than $5 000,000 worth of the product is sold annually. This was very nearly half of all the marble quarried in the United States. Nor is the end in sight. The search for new quarries still goes on, though nearly fifty distinct types have already been discovered.

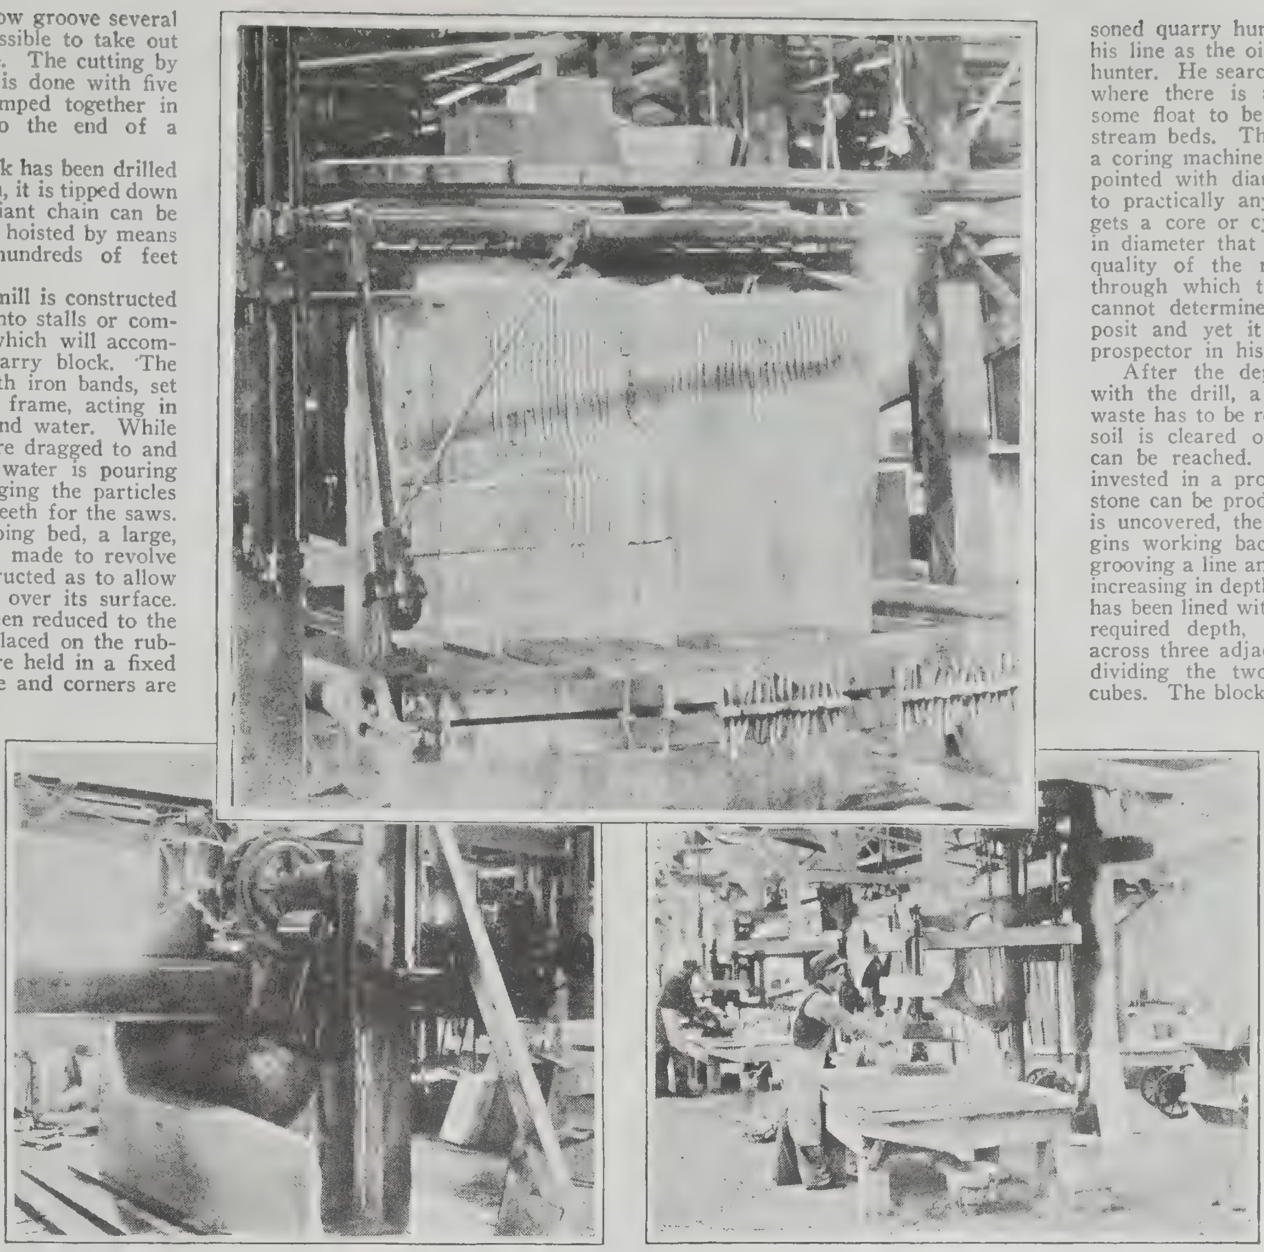
It might be thought easy to locate a new quarry, since there is so much marble already uncovered, but the seasoned quarry hunter is as experienced in his line as the oil prospector or the gold-hunter. He searches for a promising spot, where there is an outcrop, perhaps, or some float to be found washed down to stream beds. Then he sets to work with a coring machine, having a revolving drill pointed with diamonds, that he can sink to practically any depth he desires. He gets a core or cylinder about two inches in diameter that shows the structure and quality of the marble and other stone through which the drill has passed. It cannot determine the nature of the deposit and yet it is worth much to the prospector in his preliminary work.

After the deposit has been disclosed with the drill, a considerable amount of waste has to be removed after the surface soil is cleared off, before sound marble can be reached. Often $50,000 must be invested in a prospect before any salable stone can be produced. When the marble is uncovered, the channeling machine begins working back and forth on a track grooving a line an inch wide and gradually increasing in depth. As soon as the quarry has been lined with paral'el grooves of the required depth, the channelers are run across three adjacent cuts at right angles, dividing the two strips of marble into cubes. The blocks thus formed, known as "key" blocks, are broken off at the bottom by drilling and wedging. After the key courses have been cleared away, the remaining blocks in the floor are split out, both at the sides and the base, by the same process. This drill is commonly called a "gadder."

There are several ways of getting the blocks out of the quarries. At Danby Mountain, they are brought down over a mile of cable track, a drop of about 900 feet. At the West Rutland quarries part is raised by derricks and part is drawn up over an inclined cable track, everything being operated by electricity.

On leaving the mills, some of the product goes directly to the monumental shops and some for building stone.

By far the larger part of the stone that comes to the shops is delivered to the rubbing beds. Much of the work moves directly from the polishing beds to the boxers for shipment or storage. In the monument shops there is frequently another stop before the stone reaches the boxing room, during which it has to be lettered or a design traced. Tracing and lettering are separate trades and each has its own set of apprentices and journeymen.



Above—Sawing fifty-two s'abs from a marble block with a gang saw. The sawing is done by smooth iron bands, set in a moving horizontal frame, and acting in conjunction with sand and water. While the strips of soft iron are dragged to and fro across the marble, the water is pouring down over the top of the block, bringing the particles of sand which serve as teeth for the saws. At left—Cutting marble with diamonds. The rim of this saw contains 125 diamonds, imbedded in the steel. When an exposed corner becomes dull, the diamond is broken out and given a new setting. A saw of this kind, given plenty of water, will cut its way through the hardest marble. When a block of marble is too large it is cut down with this diamond disk saw. At right—Polishing a slab of marble. The work of polishing is all done by a small whirling disk which is moved about over the watered surface of the stone. The first plate used is coated with carborundum, the second with aloxite and the third with hone. To complete the process the plate is covered with felt and applied in conjunction with polishing putty.

Wooden Railroad Bridges

THE master carpenters of past generations did remarkably well in fabricating big, staunch railroad bridges from giant white pine timbers, which, like the builders, are things of the past.

A couple of fifty-year-old wooden railroad bridges of great size have just been replaced by steel viaducts, not because of the veterans failing, but to obviate the fire risk and also to anticipate the constant increase in train loads.

One of them was the 648-foot bridge of the Chicago & Alton over the Auxvasse Creek in Missouri and the other was the 480-foot Southern Railway bridge at Toms Creek in the Shenandoah Valley of Virginia.

Both of them were so-called Howe truss bridges, inclosed in sheathing which the engineers said were helpful in prolonging their years. Their honestly built masonry piers and abutments were so strong and sound that they were used to support the new steel spans.

The Auxvasse bridge had six spans, each 108 feet long, and the Toms Creek bridge had four 120-foot spans. The floor beams of the latter bridge were ten by fourteen, and it contained 300,000 board measure of lumber which was so good it was salvaged for repair work around stations.

However, the brothers, Ulric and John Grubenmann, eighteenth century Swiss carpenters, were the world's greatest builders of wooden bridges. Their designs have been copied throughout the world.

In 1758 the Grubenmann brothers designed and built the 390-foot white pine bridge across the Limmat River near Baden, which engineers concede to be the longest span and most daring project of its kind ever undertaken. Ulric Grubenmann built a famous 364-foot wooden bridge across the Rhine at Schauffhausen. It was a single span, too, but the aldermen lacked courage and put a center pier under it which seldom was subjected to load. Napoleon's armies burned both of these bridges.

One of the best stories about wooden bridges has to do with a 150-200-foot bridge built in 1850 over Pine Creek in Warren County, Indiana. It was made of solid black walnut and later many offers were made to replace it with a steel span merely in return for the then valuable wood.

Natives Still Living in the Stone Age

THE Adelaide correspondent of the *Times* says that the Australian black while in his element is a wonderful personality; out of it he is a tragic, and often degraded, figure.

"It is a matter for deep regret," says this authority, "that these amazing people are fast disappearing. Efforts to reclaim them have been so belated and spasmodic, so lacking in real and sustained earnestness, so sadly inadequate that on'y in the narrowing spheres of their fenceless domains can this noble and intensely interesting tribe be said to be holding their own numerically. Even there the shrinking is only too apparent, but the natives are true to type, with their splendid powers of physical endurance, unrivaled strategy in hunting, and fine skill in the primitive arts.

"There is litt'e doubt that the Australian aboriginal is a living representative of the fossil man of the Stone Age; most scientists are agreed upon that. He uses an ordinary fragment of stone, just as nature made it, for pounding, cracking, and cutting purposes, like an Archeolithic man. He chips the edge of other chosen fragments, much like a Paleolithic man, and he grinds and polishes other implements and weapons he makes much like a Neolithic man. He embodies in one, therefore, all the stages defined in the classification of the fossil men of Europe.

"The aboriginal of Australia is a born hunter. His sole desire and object of existence is to hunt. Most of his time is in consequence spent on the march. He has no permanent abode, and yet it would not be quite correct to call him a nomad, because he confines his wanderings strictly to the boundaries of the hereditary tribal haunts. Only when on mischief bent, or when on the warpath, is he guilty of trespassing. His favorite weapon is the spear, either plain or barbed, with which he approaches both animal and man. He projects this missile with a spear-thrower, a flat or cylindrical stick with a hook at one end to receive the end of the spear. The greater leverage thus obtained gives him every advantage in hurling the weapon for a considerable distance.

Manufacturing Gold

GOLD may soon become a cheap product of the electric furnace, no more uncommon or precious than aluminum and carborundum which are made by that means.

Newspaper reports have given such distorted impressions of recent investigations that the following notes will be of interest.

Briefly, Professor Miethe, director of the photochemical laboratory at Charlottenburg High School, Berlin, states he has succeeded in obtaining minute quantities of gold from mercury by the prolonged action of a high tension electric current.

Eminent German scientific authorities are now saying that Professor Miethe is probably wrong in supposing that transmutation could not be effected except at stupendous cost which would make the product more expensive than natural gold.

It appears that just prior to the outbreak of the war Professor Lohmann, who succeeded in obtaining with his new type of electric furnace temperatures of 4,000 degrees Centigrade or more than 7,000 degrees Fahrenheit, carried out many researches which were not published because of the war and what followed.

If Professor Miethe's experiment were repeated with Professor Lohmann's furnace instead of with vapor lamps, it is asserted that there is no reason for disbelieving the correc'ness of the calculation that three kilogrammes of mercury could be decomposed in ten minutes into gold and helium or hydrogen.

Steps are being taken to put this to the test. Should the experiment succeed the result would be cataclysmic for the whole of human society since the possibi'ities of limitless quantities of gold at a negligible fraction of the present current value would destroy all the bases on which modern monetary systems rest, and consequently on which our present conception and measures of material values depend.

Besides volatilizing such refractory elements as tungsten, uranium and carbon to form industrially important carbides, Professor Lohmann succeeded, he declares, in volatilizing and decomposing iron, obtaining a whole series of other elements though he was unable to control the rate of reaction and determine what should be the ultimate products. This remains for further research.

Looking Beyond the Veil in Spiritland

Concluded from page 3

slates furnished by himself, but he has never yet received a message at a seance at which he kept his own slate or the medium's slate, *at all times in his own hands.* There have been instances, however, in which writings have been "received" on slates furnished by the medium and held at all times in the sitter's hands, but these writings were prepared beforehand in ink which disappears when written, but appears again a certain length of time thereafter. All the other twenty-six ways of slate writing depend on interchange of slates, the writing being done by a confederate of the medium while the sitter *thinks* he is still holding his own slate. This is another demonstration of the world-wide difference between *thinking* and *knowing.*

The conjurer mentioned above as having offered to duplicate any act performed by any medium anywhere at any time has a slate-writing trick in which the pencil can be *heard writing,* apparently between the closed leaves of the slate, but it would be unfair to this clever and honest magician to reveal the secret of this trick, which, as far as the writer knows, no medium has ever been able to duplicate, even with the supernatural aid these fakers pretend to possess. Slate writing has deceived many men of wide intelligence and broad education, but there never yet has been a slate-writing medium before the public who has not at one time or another been caught in trickery. It is the belief of all the unbiased investigators of psychological phenomena with whom the writer has come in contact that there never has been a slate writing which was not done by human agency. As entertaining tricks on the stage, these clever deceptions are worth the price of the ticket but as deliberate attempts to delude men and women by attributing them to supernatural or spiritual sources, they are criminal.

The reading of sealed letters, and the answering of questions contained in them, is done by twelve separate methods, all having for a foundation the substitution of other sealed envelopes for those containing the real letters for a space of time long enough to enable a confederate of the medium to copy the questions and formulate replies to them. The thirteenth and cleverest method is that known as the "extra letter system." In this, the medium or magician distributes among his audience small envelopes containing cards; usually these envelopes are about one and one-half by two inches, or smaller, of a size easily concealed in the hand, or "palmed," in the language of sleight-of-hand performers. The sitters for the medium, or the audience for the magician, write their questions on these cards, being commonly limited to one question, "owing to lack of time and the mental strain on the medium." Each question-writer then seals his card in the envelope and all are placed on a table in front of the medium.

The latter has, either palmed or hidden behind some ornament on the table, an exactly similar card, on which a question has been written by a confederate "planted" in the audience. This card is in an envelope exactly like all the others, with the exception that one end of the envelope is torn open. With this card in its envelope concealed in his right hand, the medium picks up the first envelope from the pile on the table, holds it in his left hand against his forehead for a moment of apparent deep concentration, and speaks aloud, without unsealing the envelope, the question prearranged with the confederate, and written on the palmed card. After he has obtained a confirmation of this question from the confederate, he opens the envelope held in his *left* hand, and apparently sends it out into the audience to the confederate. As a matter of fact, the card he really sends out is the previously prepared one which, opened, he had held palmed in his *right* hand all the time.

The confederate receives this card, confirms it, and passes it about among the audience, or among the sitters at the seance. The medium now has the first of the *genuine* cards opened and palmed in his *right* hand and *knows* what is written upon it. With his left hand he picks up another of the genuine cards from the table, presses it against his forehead, goes through the concentration process, and speaks aloud the question on the card which he already has open in his right hand. After the question is read and recognized, and the second envelope opened and swiftly exchanged for the first card, the latter is sent out to its writer in the audience, while the medium has the second card, open, and with its contents known to him, palmed in his right hand. Thus, he goes through the pile until, say a half-dozen cards remain, when he suddenly announces that the hour is growing late, and his time limited, so that he will have to defer reading the remainder of the cards until the next meeting. He must do this, or he will be left with an extra card which he is unable to read, palmed in his right hand, when the table has been emptied of all the cards.

Trance-Mediumship

THIS whole trick, which is so clever that it has fooled many experienced investigators, depends entirely upon the ability of the medium or the magician at sleight-of-hand in the changing of the cards from hand to hand. This brings up the fact that, if you will watch a medium, or a stage magician do the same trick a number of times, you will find that he goes through exactly the same succession of exactly the same movements, done at exactly the same moment, in the performance of each trick. This has led to the undoing of many mediums, because the moment an investigator finds a medium doing the same thing the same way over and over again, he is certain that only human agency is involved, for if supernatural, or spirit, aid were involved, the operations would not necessarily be the same every time. A celebrated Italian medium, who, a few years ago, set all Europe by the ears, psychologically speaking, was caught by a British investigator by this very method. When he had learned the method by which the trick was done, through watching her perform the same trick some twenty times, this investigator described it to her. The woman then broke down and confessed.

The answering of questions written, as heretofore described, is more difficult than the reading of them. By careful tabulation, however, stage magicians have found that the range of questions which men and women are apt to ask is 120 in number. Of these there are seventy-five which include all those that nine persons out of ten will ask. General answers can be provided—and have been worked out—for seventy-three of these seventy-five questions. Of these seventy-five questions there are seventeen which eight of every ten persons ask on the average. To all of these seventeen, general replies can be made which will win the immediate affirmative approval of the questioner, whose mind is already bent in that direction, and whose will is functioning along the same lines as the will of the medium or the magician. As my previously mentioned conjurer friend has said to me, "The greatest aid to the success of my tricks—all of which, understand me, are entirely man-made—is the *willingness* of my audiences to be deceived. With the mediums, the greatest help to them in putting over their deceptions is the *desire* of those who attend their seances, to hear what the medium wants to tell them." In other words, the longing to hear what we want to hear, from a source supposedly beyond this mortal world, enables a crowd of swindlers to loot the people of the United States. In all truth, "the supernatural is merely the natural which we do not understand."

Trance-mediumship is probably less understood than any other form of so-called communication between the spirit world and this, yet it is by this method that the largest individual sums of money have been obtained from wealthy men in this country and in Europe. The original idea that the person "entranced" has permitted his soul to pass out of his body, and that, hence, that wandering soul could have a wider range of vision, and could communicate through the vocal organs of its abandoned body with other human beings on earth, remains to this day. Sometimes the person in the trance communicates the "messages" supposed to come from the spirit world by word of mouth, and sometimes by writing. In either case, though continuous studies of this form of automatic speech and writing have been made since about 1900, nothing has been developed to show that any communications have been received containing any material, either thought or fact, which is not known to some person connected with the test. It is true, however, that critical observers have noted instances in which the medium undergoing the trance made statements of fact, knowledge of which apparently could not have reached her in any normal manner.

Trance-mediumship has been known for centuries, devils are recorded in the Bible as having been cast out of men and women, and the early theory of trances, as well as the present idea among savage tribes, is that the person subject to such periods of catalepsy is "possessed" of an evil spirit. Some psychologists today are returning to this theory, to the extent that they think it possible for some mental control outside the body of the trance-medium to take possession of that body when the medium, by the act of going into the trance, removes her own usual mental control from authority. The whole subject is one which is believed to be closely related to telepathy. Trance-mediumship is not so frequently resorted to by those mediums who are selling their services for money as it is by believers in spiritualism, spiritism, and similar creeds, and by investigators into psychological phenomena. The few so-called "commercial" mediums, who are able to throw themselves into trances, and so impress their supernatural powers on intelligent men and women are the ones who have profited most largely by their "spiritual" operations. They are not numerous enough, however, to become any considerable factor in the separating of the general public from its money. A number of fake trance-mediums, whose trances were assumed and put through by clever acting, with the aid of make-up, have been arrested since the World War. In fact, all forms of trickery dealing with the spirit world have been reaping a rich harvest since that conflict.

A Potent Recipe

THE cleverest of all the swindlers in the supernatural, however, are the "materializing mediums," that is to say, those who claim to produce—for a fee—the materialized "spirit" of any person who has passed out of this world. There is nothing to show that any one of these materializing mediums is not a fraud, and there are thousands of records of such mediums being caught in the midst of acts of deception. So well organized is this industry of bringing back the dead for an interview with the living, that the composition of the best, most compact, and most easily handled of the materializations staged by these mediums has been carefully worked out, and the writer is in possession of the formula. That is to say, if you pay your fee, and sit in darkness while the materializing medium produces your beloved "Bill" or "Susie," you presently will see a filmy cloud of light, gradually expanding and growing in size, until you behold a luminous body, and a glowing face, which you are prepared to swear is that of your dear departed. Here is what the materialized spirit is made of, in nine out of ten cases:

Twenty-one yards of French bridal veiling, two yards wide, so fine that it can be contained in a pint cup.
One jar of luminous paint.
One half-pint of pure white transparent varnish.
One pint of odorless benzine.
Fifty drops of oil of lavender.

The bridal veiling is first washed carefully, by hand through seven to ten waters, and, while damp after each washing, is worked also by hand through a solution made of the luminous paint, the varnish, the benzine and the lavender oil, all thoroughly mixed, and kept agitated while in use. After the veiling has been put through this solution for the last time, it is put on spreaders, similar to those used for drying lace curtains and left to dry for three days to a week. It is then washed with a naphtha soap until all the odor has been washed out. This leaves the fabric soft and pliable, and still retaining the paint. The veiling so treated, if exposed to the light for two or three hours, will remain luminous in the dark for two or three hours more. When billowed up from the floor, or waved in the air, it appears as a luminous vapor, of about the same consistency as wood smoke. It constitutes the body of the "dear departed" whom the medium calls from the spirit world in return for your fee.

The medium operates this luminous, vaporous cloth either on a long bamboo or steel rod, at the end of which is attached the head of the figure, also made luminous with paint, or with his hands, covered with black gloves, which reach well up his arms, over the ends of the sleeves of a close-fitting black garment which covers him completely, including his face. The medium either sits inside the cabinet, putting his arms or the rods out through the curtains, or moves about in front of the ring of sitters. All such materializing seances are, of course, held in the darkness, so that the black clothing of the medium completely hides him from view and the "materialized spirit" appears to be floating about in the air.

Other means of materialization are by the use of a group of men and women, made up to represent different characters, clothed in the luminous material previously described, and with their faces painted with the luminous paint. One medium in San Francisco at one time had twelve such "characters" in his repertoire for materializations. Business was good with him, and he has since retired to a splendid country estate farther south on the California coast, where he takes great delight in telling his friends of the various methods by which he deluded gullible sitters into believing that their dead loved ones had returned. Such use of confederates in materializing seances, however, has two drawbacks—the danger of one of the "actors" talking too much, and the high expense, for such animated "spirits" demand minimum salaries of ten to twenty-five dollars a seance for their services.

There are at least seven other methods of "materialization," and scores of other ways of making unobservant and credulous people believe that they are in communication with the spirit world. These "systems," as the mediums call their schemes, are too numerous to be told here, but it is worth remembering as a fact that wherever a person has set himself or herself up as a medium of communication with the "other side," as they call the spirit world, and offers such services for hire, investigation has shown, without exception, that such a person is practicing fraud. There is no record of communication with the departed which will bear scientific investigation.

St. James's Palace

Concluded from page 4

Lieutenant in 1914. His disappointment at not being permitted to go with his battalion to France was bitter.

"What does it matter if I am shot?" he asked, "I have four brothers."

"If I were certain you would be *shot,*" replied Lord Kitchener, "I do not know if I should be right to restrain you. What I cannot permit is the chance of the enemy securing you as a prisoner." Just like the Prince! Just like Kitchener! It will be remembered that later he was *aide-de-camp* to Lord French and was more than once under hot fire. On one occasion he was a few minutes away from his car; came back to find that it had been smashed to smithereens. But we must retire to St. James's!

On the same floor as the hall are two rooms which are very busy secretarial offices, and next to them a quietly furnished dining room. Passing up the white-paneled staircase, the Prince's private apartments looking on Cleveland Row are reached. The sitting room is "restful," the prevailing color being the green of carpet, curtains and furniture. There is a big and always busy desk, for the Prince's "job" is not a sinecure. When he overheard a workman calling him "one of the idle rich," he promptly said: "Rich perhaps, but, hang it all, not idle!" He is usually up very early for a walk or for a gallop in the park, or for a run in the beautiful gardens of Buckingham Palace, close by. Then breakfast; then hard work, he and his secretaries dealing with the huge mass of letters, private and public, which is his "daily ration." It is his strict rule—one which all business men would do well to observe!—that every letter receives a reply. Then perhaps there may be a speech to compose, a duty which the Prince never shirks, being "thorough" in this as in everything else to which he puts his hand. And so from hour to hour most days are busily occupied, and not till every public call is answered does the Prince turn to his private pleasures.

The Prince's bedroom is an amply roomy chamber, but—he doesn't sleep there! Doing so, by preference, in the small dressing room that opens off it.

In short, the Prince is quite a natural sort of a man! For it is possible, though not too usual, to be every inch a man as well as every inch a king! He meets men and women with a stout grip of the hand and a straight look from keen blue eyes; a kindly smile is not often far away, for he loves fun and good humor. He talks well and, what is much more rare, is a good listener.

And so, farewell to Saint James's Palace, with a passing peep into the Chapel Royal, which is interesting almost solely for its memories, for therein were married Mary, daughter of Charles I and mother of William III; there the latter himself was married to his Queen Mary; Queen Anne, George IV, Queen Victoria and the present King; and the Princess Royal, daughter of Queen Victoria and mother of the ex-Emperor of Germany! Mixed memories, indeed!

And so, out of the quiet palace into the noisy street, after a visit that will linger long in mind, for there are few more historically interesting buildings in the world, and today when most European thrones have tottered to the ground, none more closely bound up with the future.

He Is Blind, But a Doctor of Philosophy

Donald W. Wheaton Extinguishes Handicap by Dogged Determination

By GEORGE C. HENDERSON

SILENCE settled over the giant crowd of 25,000 persons gathered in the University of California stadium. The last man who was to receive a degree arose in his seat. On the platform where sat the governor, judges, public officials, educators and distinguished diplomats and statesmen, the president of the university faced the direction from which the last applicant for a degree was to come. In an impressive ceremony the university had conferred degrees upon 2,154 men and women. Among those so honored was the richest man in the state, internationally known as a railroad financier, Henry E. Huntington, nephew of Collis P. Huntington of Central Pacific fame, and Dr. George Henry Falkiner Nuttal, famous Cambridge University biologist.

Expectantly the crowd awaited the 2,155th scholar.

He stepped forward, a rather stooped young man, wearing a cap and gown.

A roar of applause burst from the multitude. It shook the stadium and reverberated from its walls. Students jumped up from their seats and cheered. Even the grave and dignified functionaries on the stage clapped their hands.

Bewildered, uncertain, the object of all this approbation stood stock still. He seemed as much dumfounded over his reception as was the large number of visitors who did not know him. There was nothing distinguished in his appearance. He did not seem to be anyone in particular, and yet the applause had far surpassed that accorded to any other applicant. The only outstanding thing about him was the splash of color on the shoulder of his black gown which marked him as a Doctor of Philosophy (Ph.D.), one of the highest honors conferred by the institution. It signified that he not only had been graduated from the university but that he had accomplished three years of postgraduate work.

Then a strange thing happened. Another student stepped up and took his arm. Together they advanced to where President W. W. Campbell stood. The president extended the parchment, official recognition of Donald Whitney Wheaton's attainment of his Ph.D. degree.

But instead of reaching out and taking the sheepskin, Wheaton's hand went feeling about through the air. His fingers had to be guided. He could not see. He was blind. A blind student had attained one of the highest honors of the school, an award that thousands of "seeing" men and women had failed to achieve. That was the reason for the applause.

Donald Whitney Wheaton, blinded at birth, unable to see more than a bright smudge of light by looking directly at the sun, had conquered his disability and at the age of thirty stood there, smiling modestly as he received the applaudits of his fellow men and women.

Just how California's blind Doctor of Philosophy managed to achieve such success while living in continual darkness, he himself did not attempt to explain fully. He refused to take credit for the consuming thirst for knowledge with which he was endowed, or the intense desire to achieve something for the benefit of humanity which he has harbored since first he could reason. At eighteen he had been graduated from high school; at twenty-five he took his A. B. at the University of California; when only twenty-seven years old he secured his Master's degree, and then at thirty, his Ph.D.

The "eyes" of Donald Whitney Wheaton, A.B., M.A., Ph.D. are his strong sensitive fingers. They are seen above "reading" a United States history in Braille raised letters, while they are equally useful, as shown below, at the typewriter.

For twenty-two years he has attended school and college without being able to see one line of type. He studied geography although unable to see the maps. He played football, despite the black void that hid the pigskin from him. Botany became one of his hobbies, yet the plants which passed through his fingers were invisible to him. To accomplish his work better, he learned to operate a typewriter.

How could a blind man accomplish it?

It was to learn this that I called at his home and waited for him. Presently he came striding along the sidewalk, with his head up, just as if he could see. He carried no cane, yet he magically turned aside to escape running into a tree, which a nature-lover had permitted to grow in the parking, and deftly avoided a pedestrian.

In the garden in front of the house, he stooped, picked a flower and inhaled its fragrance avidly, like one in love with earth's manifold beauties.

As he entered the room, I stood perfectly still, and yet he came toward me and looked directly at me, inquiring: "Is this Mr. Henderson?"

"Oh, then you can see me?" I asked. "I made no noise, so you could not have heard me."

He laughed easily.

"Noises which escape the untrained ear reach those whose blindness forces them to develop other senses," he replied. "Although your breathing was slight, I could detect it."

"But how did you know it was not the maid who admitted me?" I insisted.

"Well, the maid does not smoke," he retorted quickly. "You gave off a very distinct odor of tobacco smoke. Not a cigaret, rather a cigar or pipe."

"It was a cigar," I admitted.

Wheaton was born in Alameda, California, in 1894 and a few days after his birth he became blind "through legislative negligence," as he phrased it. "If the 'prevention of blindness' bill, providing that the eyes of all infants must be washed with nitrate of silver at birth, had been passed in 1893 instead of 1897 by the state legislature, I would be able to see as well as you," he declared. "I suppose it is an irony of fate that I should discuss in my Ph.D. thesis the fight made against this bill by legislators who ridiculed it as the 'red eye' bill."

When eight years old Wheaton entered the California School for the Blind at Berkeley and studied there for six years. He learned to read "Braille," the raised-letter system of writing and printing. Laboriously he "felt" his way through geography, reading, arithmetic, United States history, and writing on the Braille machine.

Although the raised-letter system enables the blind to read by feeling the letters, it is at best a slow and cumbersome process. It takes twice as long to read as by sight, and one volume in ordinary type requires six big volumes of Braille to reproduce it.

Besides reading, he listened to lectures on various grammar-school subjects, and it was in memorizing what he heard that he developed an acute memory which stood him in good stead.

The building of a memory Wheaton considers his outstanding accomplishment. At first he had great difficulty in remembering the lectures that he heard. He set to work trying to find some remedy for it, and in the end, although only a youngster, he arrived at the same conclusion that psychologists reached later—memory is an association of ideas.

"My memory system was elementary," he explained. "For instance, I had difficulty in remembering the period during which Napoleon III ruled France, until I associated his rule with the fact that he aided England against us in the Civil War and that during this time of strife he tried to establish an American empire in Mexico with Maximilian. This fixed the Napoleonic period in my mind vividly as being almost parallel to our Civil War time.

"I applied this system to everything. I never learned a fact without trying to associate it with some other fact that was more familiar, if possible. In this way I worked out a memory system that became automatic, because it was not artificial."

It was while attending the Berkeley school that Wheaton was inoculated with his love for sport, which now causes him to attend baseball games, track meets and football battles, even though he cannot see the players nor the plays.

At the age of fourteen, his parents took him to Boston to attend Perkins Institute and from that institution he was graduated with high school credits four years later. He had developed a deep interest in history and this led him to enter Tufts College, Medford, Massachusetts (not a school for the blind), as a special student in history.

Everyone marveled at his daring in attending a school for "seeing" people, but he secured the textbooks in Braille or had people read to him those that he could not get in the blind language and by bringing his highly developed memory into play at lectures, he astounded students and professors alike. Wheaton's interest in athletics of all kinds was a source of profound wonder to men and women who could see. He became a member of the Glee Club and he attended track meets, ball games and mass meetings, where he cheered as loud and as long as any of them.

In 1916 he returned to California and entered the state university to try for his A.B. degree. He was immediately impressed by the difference between a large university and a small college. At Tufts everyone knew him and consequently lent a helping hand. At the University of California he encountered scores of people who did not even know he was blind and who were dumfounded when he removed his glasses to prove it to them.

With full confidence in his ability he took on a heavy course of study, including logic, botany, astronomy, German, Latin, history, political science and education. In astronomy, while other students could look through a great telescope and see the stars, he had to visualize them from descriptions and then remember those descriptions. In spite of this handicap, he took high honors in his class. In German and Latin he found especial application of his "association of ideas" memory system, since he could trace the roots of hundreds of words and phrases of the English language to the older tongues.

In 1919 he took a course in historiography, under Professor Henry Morse Stephens, in which he traced the development of history from Herodotus to the moderns, and in the same year was awarded his A.B. degree. Next he took up postgraduate work in political science and historical methodology, and in 1921 was awarded his Master's degree. By this time he was so much interested in California history that he decided to specialize in this field with the intention of writing it from the place where Bancroft left off in 1890, while working off the requirements for a Ph.D. He took a seminar in political science, improved his reading knowledge of French and German and plunged into the big task of writing a history at the same time.

It was with high elation that he received word to choose his doctoral committee and submit it to the dean of the graduate division. He chose Professors Bolton, L. J. Paetow, Eugene McCormick, John Van Austrin, Edward Sait, Dr. E. T. Williams and Dr. Russell.

It was with considerable trepidation that he submitted the completed thesis to the committee. He had written something which he could not even see. He could not read his own thesis and yet he had given it to a critical group of men, who had the power to refuse him his coveted degree. After ten days of suspense, he was notified that his thesis had been accepted.

But he had not yet secured his degree. He must appear before the doctoral committee and later take a public examination.

Before the doctoral committee he sat in a chair and answered questions shot at him by the men whom he had chosen. For two solid hours he stood up under the test. Then he was ushered out into a hall and told to wait. The fifteen minutes that elapsed seemed like fifteen hours. Presently the door opened and the professors came out to grasp his hand in congratulation. He had passed.

"I suggest that all applicants enter this test blindfolded," Professor Paetow proposed, "if blindness can produce such a scholar as Dr. Wheaton."

The two hours' public examination was perfunctory.

Donald Whitney Wheaton, A.B., M.A., Ph.D., at thirty years of age, is just starting his career. Only history will tell to what heights the blind historian may rise.

BRIEFLY TOLD

On the day of an eclipse of the sun the Hindu follows a strict schedule to purify himself and his belongings. He takes no nourishment of any kind during the eclipse and throws away any cooked food or drinking water he may have on hand. Brass vessels are scoured and earthen pots destroyed. Personal purification must be achieved by a bath in some stream, preferably one of the holy rivers of India.

Cocoa was discovered four hundred years ago by Spanish sailors under Columbus, who reported that it was widely relished in Mexico under the name of *chocolatl*.

The hissing Iguana, a giant marine lizard four feet long, exists only on the Galapagos Archipelago off the coast of Ecuador. It lives about the seashore and feeds on seaweeds, sleeping in a burrow of the earth or in a lava crevice at night.

Two eider ducks mounted by a Greenland Eskimo were pronounced the best-mounted birds in the academy collection by Dr. Witmer Stone, curator of the Academy of Natural Sciences of Washington.

Oil is extracted from the bodies of locusts in Germany. This oil is used in airplane motors, because it congeals at a very low temperature. The refuse from the hoppers is used as fertilizer.

The *Lusitania* cannot be salvaged as the weight of the water has long ago crushed the vessel flat and though the ship's thirty-ton safe may be strong enough to resist the pressure the chance of raising it is not worth the risk.

Despite the difficulties that beset the new government of Ireland the Dail last year set out 4,000,000 trees on more than one thousand acres of land. This year one thousand acres more will be reforested.

M. Mege-Mourees, a French scientist, invented margarine as a substitute for butter, by churning beef fat with milk. This was in the year 1868.

There are today 3,500,000 radio receiving sets in the United States.

An almanac that is three thousand years old is in the British Museum. It is written on papyrus and was found on the mummy of an Egyptian.

"One thing that stamps a man as being really among the uneducated is the fact that he has a contempt for the illiterate."—*G. K. Chesterton.*

The high price of vanilla has brought much money to Tahiti, and Papeete has acquired its first traffic cop. The number of motor cars has increased to such an extent due to the wealth of the inhabitants that the highways of the town are congested.

Huge spiders in the forests of the Amazon are capable of capturing small birds with their webs. These they kill and devour.

Pure, white flawless diamonds, cut on American standards, can be purchased in Russia at $100 a carat. The difficulty lies in getting them out of Russia on account of the Soviet ban.

There are 4,300,000 illiterates in this country entitled to vote next November.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Natives of India who preach righteousness by the mortification of the flesh have various methods. One method consists in the subject rolling over and over for a journey of a couple of hundred miles; another will have himself buried alive in a cramped but not entirely fill-in pit, up to the nostrils where he will remain for a long period. Another will hold his arm up for years at a stretch until the member withers, gaunt and horrible, like the dead arm of a mummy.

Officials of the United States Forest Service are planning to plug up with concrete holes in the bottom of Duck Lake in the Dixie National Forest in Southern Utah. It gathers much water in the spring but the water filters through cracks and holes in the bottom of the lake bed before it can be used in summer.

The Turkish Government has decided to sell the famous palace of the Sultan at Constantinople, according to reports. It will be auctioned, with a reserve price of about a million dollars.

A giant mushroom found near Boston weighs forty-five pounds and measures thirty-two by forty-one inches. It is on display at Horticultural Hall, Boston, and is known as *Polyporus Berkeleyi.*

Judge Alfred J. Talley, of the Court of General Sessions in New York City, while inducting into office a new jurist said, "One of the things that you will come to learn is that you have come on the bench of the greatest criminal court in the world, and the oldest court of any kind in the United States, at a time when this country is suffering under an indictment which proclaims it to be the most lawless on earth. You will find that the United States must plead guilty to that indictment. Most of the desperate criminals are mere boys. You will be heartbroken at discovering that the vast majority of defendants are under nineteen or twenty years old. That is going to be your most distressing problem."

The United States Department of Agriculture estimates there will be 12,787,000 bales of cotton produced in the United States this season.

Guatemala ranges in altitude all the way from sea level to about 14,000 feet, or nearly as high as Pike's Peak, with an average elevation of probably 5,000 feet. The temperature varies from 50 to 85, with cool nights all the year round in the temperate altitudes.

A deckman on the sixteen-thousand-ton liner *Arabic* was swept from one deck of the ship by the onrushing water in a heavy storm. He was landed by another sea on the deck below uninjured except for minor bruises.

What is said to be a record yield of strawberries for Pennsylvania has been reported from Schuylkill County where Elsie Artz, a thirteen-year-old girl member of a strawberry-growing club, raised 812 quarts of berries on one-twentieth of an acre. This is the equivalent of more than sixteen thousand quarts an acre.

Military traditions in China provide for suspension of hostilities when the weather becomes bad. A terrific rainstorm, which continued several hours, recently halted fighting between the Che-Kiang and Kiang-Su armies west of Shanghai.

A plant native to India called the carrion plant recently bloomed in Kew Gardens, England. The flower has a strong smell as of tainted meat which attracts flies to it.

Georges Clemenceau is now living in a tiny house in Vendee, France, and does his own marketing. He engages in literary work and passes his days in his garden among his flowers and trees. He will not discuss politics.

"Remember that talking is one of the fine arts—the noblest, the most important and the most difficult—and that its fluent harmonies may be spoiled by the intrusion of a single harsh note."—*Oliver Wendell Holmes.*

The city of Cohoes, New York, is building houses for sale to its citizens.

In an effort to protect its Eskimo subjects from drink and disease, the Danish Government has kept such close watch over most of Greenland that very little is known of its topography.

At the bottom of a lake in the Alban Hills of Italy lie two galleys which were fitted out as floating palaces of pleasure for the Roman Emperor Caligula. They were incrusted with marble, ornamented with precious metals and painted woods and were adorned with statuary. At the emperor's death his successor took no interest in the vessels and allowed them to rot until they finally sank. The water may be drawn off the lake until the vessels are exposed to view.

A Boston judge has ruled that the next motorist who goes before him on the charge of operating without adequate brakes must memorize chapter ninety of the Laws of Massachusetts in its entirety and recite it in the Public Square.

The Chinese celebrate New Year's Day by paying their debts.

Prinz August Wilhelm, son of the former German Kaiser, holds a clerical position in a Berlin bank and daily rides to and from work in a second-class railway coach.

One man out of every twenty-eight is still needed to meet the varied transportation problems of Japan.

Authorities Discuss Effects of Tobacco on the Body

By IRVING FISHER
PROFESSOR OF POLITICAL ECONOMY, YALE UNIVERSITY

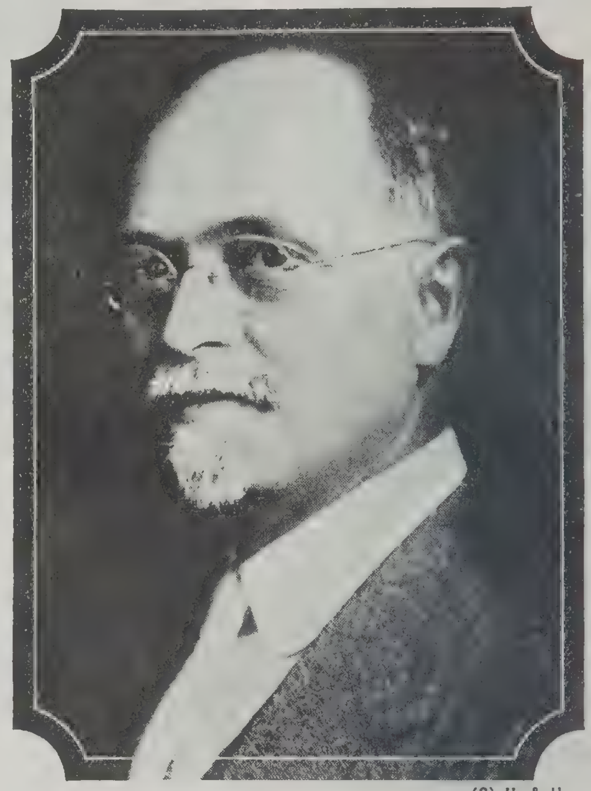
Copyright, 1924, by Irving Fisher.

Last year, when THE DEARBORN INDEPENDENT published an article by Luther Burbank on tobacco, certain parties charged that here was the beginning of a new prohibition crusade. Nothing was further from our mind.

Now, however, comes one who is perhaps the best-known economist in the country, Irving Fisher, professor of political economy at Yale University, whose work, "Stabilizing the Dollar," marks a great advance in economic thought—and he also has ideas on tobacco. It is at least interesting to know what a great political economist thinks of tobacco.

This and the succeeding articles have been submitted to authorities in the various fields involved, and have been approved by them.

Irving Fisher has been professor of political economy at Yale since 1898. He has also served the National Association for the Study and Prevention of Tuberculosis, and the American Association for the Study and Prevention of Infant Mortality. Among the many books he has written are: "The Purchasing Power of Money" (1911); "Why Is the Dollar Shrinking?" (1914); "Stabilizing the Dollar" (1919).



(C) U. & U.

PROFESSOR IRVING FISHER

Introduction

THERE was a time when the economist felt it no concern of his how beneficial were the things that people bought with their money. He believed he should merely record the facts. It made no difference to him whether the money was spent in healthful or unhealthful ways, in moral or immoral, constructive or destructive ways.

To assess values, we must, however, inquire not only as to what people do buy, but as to what they should buy for their own best good—that is, what they would buy if they were more enlightened. Values depend, in the last analysis, on other than commercial factors. There is a vast difference in the value to society of capital spent in dark-roomed tenements, unclean dairies, adulterated food, gilded saloons, bucket shops, obscene literature and houses of prostitution, and capital invested in purifying the water supply, safeguarding milk against infection, cleaning streets, building sewers, controlling undesirable immigration and building schools and hospitals. There is a vast difference in the value to a diabetic patient of a fake patent medicine which costs him $100 and a course of genuine and efficient insulin costing the same sum.

Our first task, then, is to discover the essential nature of tobacco. Is it wholesome like food, medicinal like quinine, noxious like opium, or harmless like chewing gum? It has been thought to be each of these four things at different times and by different people.

Fortunately, we now have sufficient information regarding the effect of tobacco on the human body to answer these questions with confidence.

The Heart

"Toxic anginas are most frequently brought on by tobacco," is the statement of Dr. Alexander Lambert, writing in Tice's "Practice of Medicine." "There are a large number of persons in whom tobacco causes a *precordial* pain," Dr. Lambert states, "but this pain does not go to the severity of an *anginal* attack, nor does it become *substernal* or radiate in the usual way. Patients who suffer real angina, however, increase the number of their severe attacks by the use of tobacco." He cites instances of patients with this trouble who gave up tobacco with benefit, and of some who later took it up again with fatal results. The most frequent effect of tobacco on the heart is to cause extra systoles—that is, skipped beats—in Dr. Lambert's observation. Sir William Osler cited the cases of three friends of his, apparently strong, healthy men, all of whom died suddenly, and it would seem from the effects of tobacco on the nerves of the heart.

In an investigation made by Dr. George J. Fisher, of the International Committee of the Young Men's Christian Association, and Elmer Berry, professor of physiology of the Young Men's Christian Association at Springfield, Massachusetts, it was found that smoking raises the heart rate and the blood pressure, and that it markedly delays the return of the heart rate to normal after exercise. These effects were caused by *moderate* smoking, and were produced in healthy, vigorous young men in prime condition.

Effect on Circulation

M. ABEL GY, of Paris, who made a special and very extensive research, found that tobacco gives rise to a series of functional disturbances in different organs, especially the heart.

A survey of the evidence that tobacco affects the heart was made by Dr. J. H. Kellogg, superintendent of the Battle Creek Sanitarium, and the results reported in a book, entitled "Tobaccoism." All of the important experiments were reviewed by him. He found that every authority agrees that tobacco is a heart poison.

Blood Pressure

A great authority on blood pressure, the late Dr. Janeway, of Johns Hopkins Hospital, stated: "Tobacco, or its alkaloid nicotine, has a powerful action on the circulation. Nicotine, in less than overwhelming dose, produces an immense augmentation of blood pressure in animals. Cook and Briggs have called attention to the temporary elevation of arterial tension during smoking. They found it most marked when a strong cigar or an old pipe was used, and continuing an hour or more after the smoke was ended.

Blood pressure, as affected by smoking, was also investigated by Dr. Sheldon, of Cornell University Medical College Clinic, in a group of fifty-eight persons of middle or advanced life, all of whom presented hardening of the arteries with high blood pressure. In hardening of the arteries any influence modifying the blood pressure becomes a very important matter. The studies lasted more than a period of three years. The aim was to find out whether or not the use of tobacco gave rise to lasting ill effects, and whether or not those effects were uniform in different patients. It was found that the effects were not uniform. The report of the experiments states that "whereas the risk from any elevation in blood pressure increases greatly the higher the initial pressure in the patient, it is undesirable for anyone having a constant systolic pressure much above 200 millimeters to smoke, and smoking is equally undesirable for anyone having a constant initial pressure above 160 millimeters when the use of tobacco is found uniformly to produce a considerable rise in blood pressure."

Writing on the effects of cigar and cigaret smoking on certain psychological and physiological functions, Robert Lee Bates, of the Psychological Laboratory of Johns Hopkins University, summarizes as follows the results of an investigation: "The effects on healthy adult reactors, of smoking a cigar or three cigarets, are to produce a rise in systolic and diastolic blood pressure, and in heart rate. This rise varies in amount and in rapidity from reactor to reactor, and from day to day for the same reactor."

References to the effect of tobacco on the raising of blood pressure should be very cautious, in the opinion of Dr. Eugene L. Fisk, medical director of the Life Extension Institute. He says, "Recent testimony would indicate that high blood pressure as a rule is not one of the large effects of tobacco indulgence, although in individual cases it might have a distinctly unfavorable influence on high blood pressure. My observation is that tobacco is likely to cause depression of the circulation and disturb the nervous mechanism of the heart and circulation, rather than to produce high blood pressure. Tests made by Dublin indicate that, following the smoking of a cigar or three cigarets, there is a rise in systolic and diastolic blood pressure and in the heart rate. The rise usually amounts, however, to only a few millimeters, and is hardly greater than the normal variations which occur in the blood pressure from various causes.

Depresses the Nerves

"IN A group showing high blood pressure, the proportion of excessive tobacco users was not greater than in the general group of policyholders. Similarly, in a group of excessive tobacco users, the proportion of high blood pressure cases was not greater than in the average group of policyholders. The following differences were shown, however, in the group of excessive tobacco users: There were ten per cent more cases of advanced and serious organic affections, six per cent more cases showing arterial changes, fifteen per cent more cases showing over-rapid pulse, fifteen per cent more cases showing caries of the teeth, thirteen per cent more showing recession of the gums and twenty-seven per cent more showing pyorrhea. These unfavorable mouth conditions are very commonly noted among tobacco users, and are a matter of general observation."

Arterial changes from tobacco have been noted in various experiments on animals. Gy's experiments showed that tobacco is a poison to the arterial coats, but his observation was that it acts slowly and through hypertension. From clinical observations, some of the world's best medical authorities claim that the same conditions are brought about in man by heavy smoking.

The Nervous System

The effects of tobacco upon the nervous system were investigated by L. Pierce Clark, M. D., visiting neurologist to the Randall's Island Hospitals and Schools, and consulting neurologist at the Manhattan State Hospital in New York. "Tobacco is primarily a cardiovascular poison," he concludes. "Its acute toxic effects on the neuromuscular apparatus are, first, as an excitant and mild convulsant; second, a motor nerve depressant, and finally a paralysant of the central and peripheral nerves of the heart and lungs. Its chronic effect on the nervous system, as yet so inaccurately studied, appeared to induce toxic congestion of the brain, spinal cord and peripheral nerves, inducing finally in the latter a mild degenerative neuritis."

Precision of muscular motions, as demonstrated by drawing a line between two closely parallel lines or lunging at a target with a fencing foil, was shown by the Fisher and Berry experiment to be definitely decreased after each smoking of a single cigar. It was also found that there was an average decrease of twelve per cent in accuracy of pitching a baseball after smoking one cigar, and a loss of 14.5 per cent after smoking two cigars. Given thirty minutes to rest after smoking their cigars, the increase in accuracy caused by this rest averaged nine per cent. The real loss due to smoking while resting was, therefore, twelve plus nine per cent, or twenty-one per cent for one cigar, and 14.5 per cent plus 9, or 23.5 per cent for two cigars. The writers concluded that clear eyes, steady nerves and muscles capable of accurate response do not go with smoking.

Tuberculosis and Tobacco

BECAUSE of the fact that smoking is so widespread among soldiers, Dr. Fisher and Professor Berry investigated the effect of smoking on rifle shooting. They found that the men increased in efficiency after resting without smoking, and decreased in efficiency after smoking; and that the greater the amount of smoking, the greater the decrease. Comparing regular smokers with non-smokers, the smokers were found to be slightly better marksmen, but the per cent loss or gain showed the effect of resting, in the first place, and the effect of smoking, in the second case. The smokers were affected the least, in either case, the non-smokers being more efficient after resting, and losing more in efficiency after smoking.

The Eyes

Among the nicotine affections of the nerves of the brain observed by L. von Frankl-Hochwart, university lecturer on neuropathology, Vienna, the most interesting is that of the nerves of sight. Heavy smokers not seldom complain of specks before the eyes, with which symptom often, but not always, a sense of pressure in the head is associated.

Optical disorders due to a combination of tobacco and alcohol have been observed by Dr. Kellogg, but he claims that there is also a dimness of vision due purely to nicotine. Color vision for red and green is also often impaired by tobacco, he finds, as well as changes in the pupil.

Impairment of eyesight by tobacco was studied by Dr. Francis Dowling, who examined men in a tobacco factory. Their ages ranged from thirty-five to sixty-eight years. They were among the heaviest consumers in a factory. He found a gradual progressive failure of vision in both eyes, persistent contraction of both pupils generally present, and the papilla of the optic nerve more usually red in the early part of the affection. Nicotine was the cause of the mischief, in his belief.

An irritation of the mucous membrane of the eyes is also a common affection in smoking, and caused directly by the smoke.

Tuberculosis, Cancer and Other Affections

The death rate from tuberculosis is higher in the tobacco industry than in any other of 500 occupations except marble and stone cutting, says Professor Roman. Dr. Huber's observations at Columbia University led him to the conviction that unquestionably tobacco predisposes to pulmonary tuberculosis, and that when diseases of respiration have developed, the tobacco habit certainly aggravates them.

The histories of 100 cases of mouth cancer were studied by Dr. Robert Abbe, of New York, who found that there were ten women and ninety men, and that almost every man had been an inveterate smoker. In one of the worst cases of cancer of the tongue in a woman, inquiry showed that the cancer began from a

"Out of Portland" in Pursuit of Swordfish

How the Hardy Toilers of the Sea Drag Delicacies From the Deep; Sailors Old and Young Lured by the Thrill of Their Avocation

By MAY B. WHITING

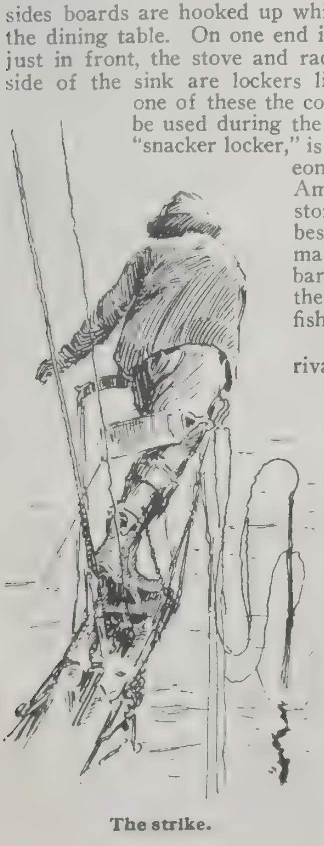
"PORT," cries the lookout from his station high above the masthead. "Port, port," repeats the topmastman with sweeping gesture, and with a crash the boom swings over and the boat is off toward the two black fins that rise above the water. The "striker" grasps his pole with both hands and leans hard against the iron frame above the bowsprit, and a man on deck makes ready to heave over the barrel. "Stiddy," cries the topmastman, and the vessel veers about, straight ahead this time, until the bowsprit and the tense figure at its end are almost above the dark-blue shadow just beneath the waves. With a little hiss the iron shank from the pole and "lily iron" strike the water, the barrel buoy splashes overboard, and the most exciting fishing on the Atlantic Coast is on.

Every year, about the tenth of June, the swordfishing fleet starts out of Portland—the *Sunapee*, the *New Dawn*, the *Alice M. Doughty*, the *Lochinvar*, the *Benjamin Thompson*, the *Bessie and Bernie*, and half a dozen others. Since the middle of May there has been a general cleaning up from stem to stern, decks scraped and painted, the "doghole" varnished, sails mended, engine overhauled, and down below well "smoked out" until everything is trim and shipshape. There is all the excitement of a brand-new venture among the crews, husky lads from the islands and bronzed and grizzled sailors who inwardly growl against the urge that leads them year after year into the dangers and discomforts of fishing on the Banks. Along the waterfront the decrepit old fishermen feel again the thrill of youth as they watch the preparations. Then they enviously bid the departing ships Godspeed and wag their heads and speculate as to who will be "high line" this year.

The first run out of Portland is usually down the coast toward Boothbay, to "ice up" at some fishing hamlet where ice is cheap, as at Cundy's Harbor or Horse Island. Then off for George's Banks, a thirty-six hours' run southeast by south from Portland lightship, or the longer Cape Shore trip to Cape Sable and eastward along the western bank of Cape Breton Island, a gay voyage in a spick-and-span vessel, hearts light in anticipation of the sport and good luck at its close.

The swordfishing boat is a two-masted schooner about eighty feet long, and drawing ten feet of water. Its mainmast is from sixty to seventy feet high and the lookout is built up twenty feet above. On the end of the bowsprit is rigged the "pulpit." At the tip beyond the jibstay an iron bar rises about three feet high. At its top a rod of iron is bent backward in a semicircle, with a swinging seat suspended from its two ends to accommodate the striker when not in action, while a platform about two feet square gives him a firm footing. About the deck, near the rail, are barrels on which the name of the ship is painted and a hundred fathom of line is coiled about each one. On one side of the deck five dories are piled one within the other, and amidships, tied up in bundles, are the boards which make the pens in which the fish are to be packed.

The swordfisher is equipped to carry twelve or fourteen men, but seven or nine as a usual thing make up the crew. There are bunks for four aft, the captain, the engineer, and two others, and from their "doghole" the engine room opens. Toward the bow of the boat are the remaining bunks like long shelves against the sloping walls. The mainmast runs up between them and on its sides boards are hooked up which, when let down, form the dining table. On one end is the sink and pump and just in front, the stove and racks for dishes. On each side of the sink are lockers like small cupboards. In one of these the cook puts the provisions to be used during the day, while the other, the "snacker locker," is open for frequent luncheons or "mugging up." Amidships are the ship's stores, and she carries the best of everything on the market, the ice, twenty-five barrels of fresh water, and the hold to be filled with fish.

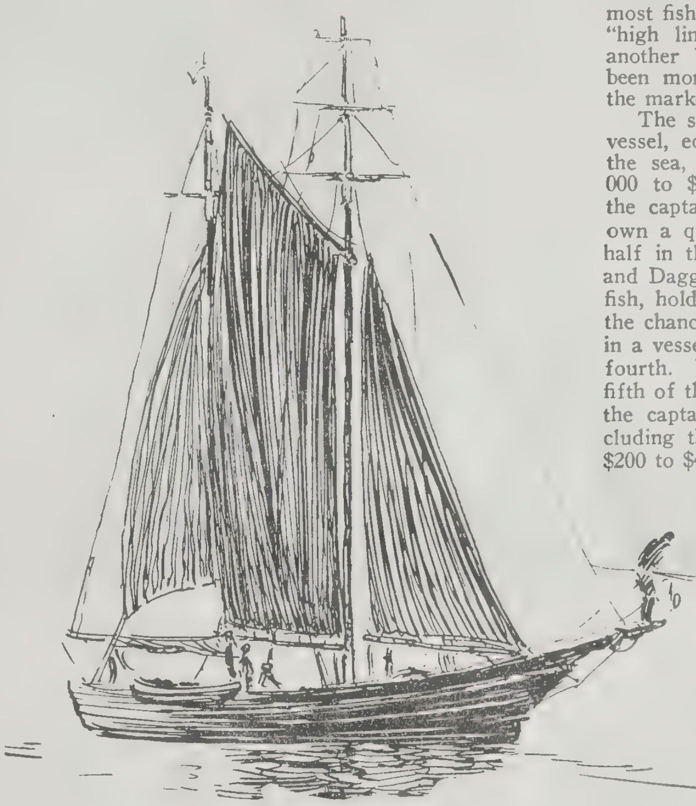


The strike.

The morning of their arrival on the Banks, as soon as the sun has warmed the water enough to lure the big fish to the surface, work begins. The striker, "oiled up," that is, with his oilskins on, for the lurch of the vessel may plunge him in the waves, makes his way along the bowsprit to the pulpit, and takes his pole and fastens a line to it, securing it to the vessel.

The pole is about fourteen feet long, of hardwood, with an iron shank to which is fastened the "swordfish dart" or "lily iron." This is a two-pointed piece of metal about four inches long, having in the center a socket into which is inserted the end of the shank, and to it is attached also the harpoon line. When the dart enters the side of the fish and is released from the pole, it at once turns at right angles to the line, so that it is impossible to pull it out.

The topmastman, who organizes the work, climbs to the dizzy, swaying loft for a long day of ten or twelve hours. Four men mount to positions below him on the lookout, and those on deck stand ready to tend the barrels or put overboard the dories. When a man on the lookout spies a fish he "sings out" to the topmastman who lays the course for the skipper at the wheel, shouting "starboard" if the vessel should veer to the right, "port" to the left, and "steady" if straight ahead. When the bowsprit is nearly over the fish, the striker throws his pole, the weight of the iron shank driving the dart, with harpoon line attached, into the body. The fish immediately dives, playing out the line on the barrel which is heaved overboard and towed hither and yon, marking the spot where the prey is struggling.



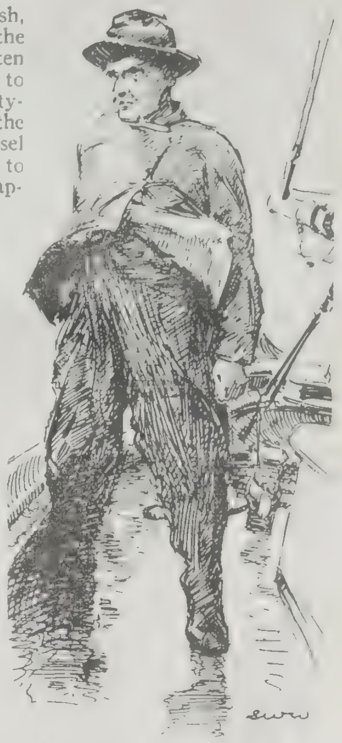
The striker in the pulpit.

At once a dory is lowered from the deck and a man jumps into it and rows to the barrel, playing the fish. This must be done with care, for if the line is too taut, the fish is likely to follow it and run his sword through the dory. The idea is to tire him out until his power of resistance is slight. Then the fisherman rows alongside and "bleeds him" by plunging a sharp lance into the gills. Sometimes, then, the fisherman can take the sword under his arm, and, by tipping the dory, roll the fish inside, but usually the vessel sails alongside, a rope is passed around the small of the body near the tail, and the fish hoisted aboard by a tackle. In the meantime, a line from another barrel has been passed to the striker who has rigged his pole for another catch.

Sometimes, if the fishing is especially good, all twenty-five barrels will be out, but five to ten fish is a good day's work, and twenty-five to thirty is rare good luck. At sunset the fish leave the surface, and, on shipboard, the work of cleaning begins. A couple of blows with the axe removes the sword, the head and inwards are thrown away, and the fish is carefully washed and packed in ice. Anything less than a hundred pounds is a "baby" and the usual run is from two hundred to three hundred and fifty, although five hundred pounders are occasionally caught, and they have been known to run as high as nine hundred.

In very rough weather swordfish will not come to the surface, so there is no fishing. Fog is always more or less prevalent on the Banks and it is one of the greatest dangers to the swordfisher, for besides the liability of collision with other small craft, the boats lie directly in the path of the ocean liners. Besides that, there is almost invariably a "blow" in August which may cause disaster to the fleet. During their days of enforced leisure the sailors, especially the old-timers, help pass away the time by scraping with glass and carving into ornaments the swords, which are about four feet long and white, streaked with dark at the smaller end.

It usually takes a vessel about three weeks to complete a trip of swordfish, although, if lucky, the hold may be filled in ten or twelve days. Fifty to a hundred and twenty-five fish make up the catch and the vessel "stocks" from $1,500 to $4,000 a trip. The captain must use his judgment in regard to the return to get the best price for his fish. He may think that the last of the week is a poor time to put his catch on the market and so "lay by" for a day or so. If it happens that two or three other captains have the same idea all will be the losers. Sometimes the vessel that brings in the most fish fails to be "high line" because another boat has been more lucky in the market.

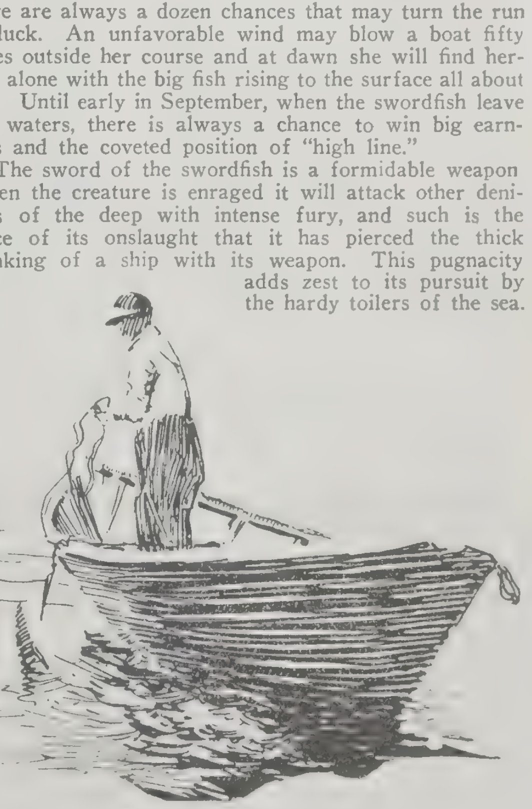


Keeping a weather eye open.

The swordfishing vessel, equipped for the sea, costs $10,000 to $16,000 and the captains usually own a quarter to a half in their boats. In Portland, the firm of Willard and Daggett, who handle the largest per cent of swordfish, hold an interest in the fleet, and others, who love the chances and the excitement of the sea, like to invest in a vessel, the basis of division being always one-sixty-fourth. When a trip of swordfish is brought in, one-fifth of the proceeds goes to the vessel, then, except that the captain has a certain per cent over, all hands, including the cook, share alike. The fisherman receives $200 to $450 for his trip and $900 to $1,200 for his season's work. And the dealer takes his share in the fisherman's gamble. Ordinarily the flesh of the swordfish is firm and hard and of a delicate salmon color, the best fish on the market to keep. But once in a while the dealer gets a "jelly fish," one in which, for some unknown reason, the flesh is soft and pulpy, and it is only when the steaks are cut that this condition is discovered. Such fish are always caught late in August and the theory is that an overabundance of food has caused too much fatty substance in the body.

Alongshore, the old fishermen eagerly await the return of each schooner. The news of the amount of fish caught and the price received flies along the waterfront and is compared with previous trips of the vessel. No baseball fans keep closer watch of their favorite stars. And it is a game that never loses its zest for there are always a dozen chances that may turn the run of luck. An unfavorable wind may blow a boat fifty miles outside her course and at dawn she will find herself alone with the big fish rising to the surface all about her. Until early in September, when the swordfish leave our waters, there is always a chance to win big earnings and the coveted position of "high line."

The sword of the swordfish is a formidable weapon When the creature is enraged it will attack other denizens of the deep with intense fury, and such is the force of its onslaught that it has pierced the thick planking of a ship with its weapon. This pugnacity adds zest to its pursuit by the hardy toilers of the sea.



Ready to "bleed" the fish.

China's "Stooping Soldiers" and Their Ways

Revolution and Counter-Revolution Breed Banditry in Land of Bugaboo

By CARROLL K. MICHENER

WE HORRIFIED our relatives at home in the "States" with the news that, owing to having acquired certain contagious bacteriological organisms from a germ-laden coolie in a Shanghai print shop, we were doomed to incarceration for six weeks in an isolation hospital. Without assurances and qualifications this was alarming information. The home-folk idea of doctors and hospitals in China, it appeared later, was based upon the general understanding that Chinese medical practice hinged upon the use of such nostrums as toads' lungs, fried beetles, powdered stag horn and red-hot needles.

Such materia medica still persists in China, it is true, but there are enough modern hospitals, and doctors trained to the Western science of medicine, so that, unless particularly desired, dried, red-spotted lizard skins need not be taken internally to cure a cold, or heated brass coins pressed to the bare shoulders to allay a fever.

China's sanitary reputation, nevertheless, is exceedingly bad. Its reputation in nearly every respect is bad. It is still, for most of us, a "heathen" land. We are supposed to differ from the Chinese as white does from black. Their manners, customs and beliefs are understood to be in exact antithesis to ours. They are assumed—and popular fiction has done much to cement this belief—to be inscrutable and oblique, beyond all hope of Western conception.

China, in fact, is to us a land of bugaboo. Our careless and fragmentary knowledge of it puts the nation under a dark, mysterious, prejudicial cloud. It is understood to have achieved a great civilization, centuries ago, but at present to have emerged only a halting step or two out of a long intervening period of barbarism. Its reputation today is for atavism, more, probably, than for culture.

It is a rare person with any knowledge of China who fears the Chinese. Dr. Arthur H. Smith, one of the greatest of the Sinologues, has written: "We must confess to a decided conviction that human life is safer in a Chinese city than in an American city—safer in Pekin than in New York. We believe it to be safer for a foreigner to traverse the interior of China than for a Chinese to traverse the interior of the United States. It [illegible] remembered that the [illegible]s a whole are quite as ignorant as any body of immigrants in the United States, and not less prejudiced. They are, as we constantly see, ideal material for mobs. The wonder is not that such outbreaks take place, but that they have not occurred more frequently, and have not been more fatal to the lives of foreigners."

It is possible that, inheriting the white man's prejudice against yellow men, we were a little apprehensive of China as we passed, in the turbid estuary of the Yangtze River, the first outposts of the ancient East—idling, lateen-sailed junks. We thought, quite naturally, of pirates, pigtails and bloody clipper-ship days of the tea-trading era. But when we came to reflect upon it, even the Chinese pirate was a poor sort, mild in barbarity and blood thirst by comparison with the terrible Morgan and Teach and a multitude of other European and American pirates who spread ghastly terror over the Spanish Main.

Wicked as China was supposed to be, we found the old virago, in this respect, something of a disappointment. The more we saw of the Chinese people the more we were inclined to agree with the Sinologues that John Chinaman, on the whole, was a peaceful, law-abiding, mild-mannered creature, given to compromise and mutual adjustment rather than to abrupt, homicidal violence.

We went alone into the highways and byways of China, adventuring ignorantly, sometimes, where it was an impoliteness to go. We walked singly and unescorted through Chinese cities and villages, by day and by night, jostling among crowds or listening to the echo of our footsteps in empty midnight streets, without ever the suggestion of danger. We were not conscious of insult, though there was the occasional half-playful cry of "foreign devil" from some tagging urchin.

Banditry, perhaps, is not taken so seriously in China as in America. It is an old disease—far older than lynching, of which America is apparently so complacent. China has developed, as far as its own feelings are concerned, a sort of immunity to brigandage. Every province is afflicted with it. This has been so for hundreds of years. Walls and ramparts of both cities and hamlets, not always gone to decay, still attest it.

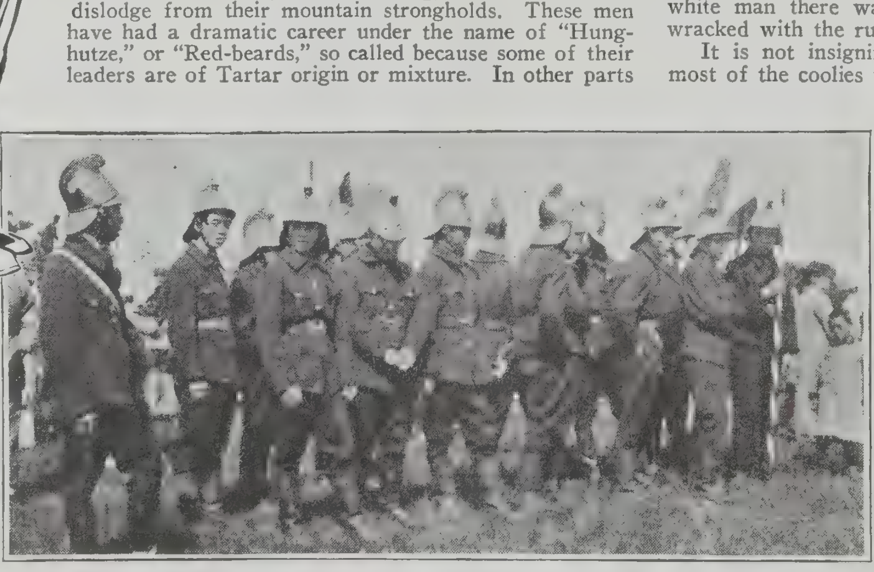
Chinese history, in fact, is full of bandits. Without them popular legends would be exceedingly dull. Some of the greatest Celestial heroes both of fiction and of fact have been outlaws very much like the leaders of the Lincheng affair, somewhat glorified in perspective. There are few plays upon the Chinese stage, either of ancient or modern vintage, that do not have a plot angle bearing upon the ever-present danger of falling into the hands of bandits. More than one Chinese dynasty, indeed, has been founded by a powerful outlaw who succeeded in gathering to himself armies that could outfight the troops of the reigning monarch. There is a modern example of this sort of hero in General Chang Tso-ling, leader of the revolutionary faction that controls Manchuria. It was as a bandit that he began his career.

Entrance to the yamen, or official residence, of a tuchun, one of China's military governors.

Chinese cavalrymen of the new school.

The Lincheng outbreak of brigandage, which came so dramatically to the attention of the outside world—precisely as it was intended—was the culminating episode in a series of operations by the patriotically styled "People's Self-Deliverance Army of Shantung." The enterprises of this fairly well-organized body were confined to parts of the provinces of Shantung, Honan, Anhwei and Kiangsu. There is hardly a province in all China, however, that has not similar affliction. Some districts seem to have been perpetually in bandit hands.

Parts of Manchuria are ruled by outlaws whom even the erstwhile bandit, General Chang, has been unable to dislodge from their mountain strongholds. These men have had a dramatic career under the name of "Hunghutze," or "Red-beards," so called because some of their leaders are of Tartar origin or mixture. In other parts of China bandits are usually less theatrical and romantic, a more or less floating population recruited from unemployed laborers and demobilized soldiers. Banditry, in fact, is essentially a problem of unemployment. Work to do, with a living wage for it, is probably the only cure.



The fire brigade, native city of Shanghai.

Perpetual as banditry has been in China, the people have never found it sufficiently irksome or perilous to general safety to warrant heroic measures of suppression. They seem to have been negligent of it, partly because of inherent peaceful inertia, and partly through toleration. The institution has always seemed to them something of a necessary evil, like famine or plague. It was a natural manifestation, and they understood it as such. People—often their neighbors, and potentially themselves—were driven to it by necessity, just as large numbers of them became periodically or permanently beggars.

The current prevalence of banditry has been aggravated, of course, by other than these general causes. Militarism has China in its grasp. Revolution and counter-revolution have bred outlawry where industrious peace otherwise would have been sustained. Unpaid, mutinous or disbanded armies have recruited the brigand ranks.

The epidemic of militarism is something of a paradox, though it is no less actual for the matter of that. Much as warfare has figured in their long history and abundant legend, the Chinese are essentially unwarlike. Many of their "bloodiest" battles have been fought without the loss of a single life. The soldier, in China, has always stood at the very bottom of the social scale. He was both feared and despised. The Chinese proverb that best characterizes him says: "You don't make nails out of good iron; you don't make soldiers out of good men." And, incidentally, there is a bit of spice in the wording of the saw, outside of its meaning, because of a pun upon the word *ting,* which signifies both "soldier" and "nail." This traditional disrepute of the soldier must be considered in grasping the full opprobrium of the colloquial term for bandits, who go by the name of the "stooping soldiers."

It would be idle to attempt an estimate of how much of China's militarism and consequent political chaos is attributable to the war in Europe. This was, nevertheless, an undoubted factor. First, there is the example of it to be considered. The thing was contagious, a disease sweeping over the world. Then there was China's actual participation in the war. She was coaxed into it, practically forced into it, by the Allies. Armies were recruited, war materials were poured into the country, principally from Japan. This played into the hands of the *tuchuns,* China's military tyrants, and prepared the way for internal wars, of which there had already been enough since the struggle for independence.

But one of the most potent, though less apparent influences toward the state of lawlessness that lies behind the recent aggravation of banditry was the coolie invasion of Europe. This episode was one of the most dramatic gestures of the war. It carried more than two hundred thousand of China's best laborers to the shops, fields and even the battle grounds of France. These men were victims of a great disillusionment. They had been accustomed, in China, to accept the white man at his own valuation. His conduct among them had always been that of a superior being, incapable of descending to a menial task. His social life was a thing apart and unapproachable. But in Europe all was different. The white man there was as miserable as he, bowed and wracked with the ruin of war.

It is not insignificant that the region from which most of the coolies who went to France were recruited comprises roughly the bandit region in North China to which the eyes of the world were directed by the kidnapings at Lincheng.

The Chinese, in fact, have risen in self-esteem. Their attitude toward men of the Western world has undergone a radical change from that which actuated the Boxer Rebellion. The animus then was mingled ignorance and fear. Today it is supplanted by familiarity and contempt.

The great spectacle of the Western world destroying itself in Europe did not strengthen China's idea of the white man's invincibility. Still it is to be doubted if the apparent breaking down of both fear and respect for Europeans has brought with it the slightest danger of another revolt of violence against the white man. The Boxers were fanatics, and their followers were filled with fear and misunderstanding of the foreigners. Today all China knows the foreigners better, and fears them little, if at all. The foreigner is far safer in China, therefore, than ever before, and he was never in great danger, if the old foreign residents there are to be believed. The Chinese, peace-loving and kindly as a people, have no longer the old, superstitious mob impulse to kill.

The great and growing jealousy of the white man

(Concluded on page 14)

Homes by the Million—MacDonald's Problem

Nine Million Toilers Approaching Slumdom Issue an Urgent Ultimatum; Demand Fulfillment of Pledge When Premier Promised Better Homes

By ALLAN L. BENSON

WE READ that Ramsay MacDonald is here, there, everywhere—making speeches to the League of Nations; concluding a treaty with the Russian Soviets; fixing things up with France; playing the rôle of high statesmanship with great success—

But can he build houses?

If he can, he may remain Prime Minister of Great Britain for a long while. If he cannot, he will have to go.

The Labor government of England must stand or fall upon its ability to grapple with the housing problem.

We have a housing problem in the United States that was created by the war. England's is not that kind. It was made worse by the war, but it began a very long while ago and has an interesting story behind it. *The British Isles were short of houses as far back as 1801.*

The British Isles are short of houses because they have had too much prosperity. This sounds like nonsense, but it isn't. Countries that have never had a prosperous day always have enough houses. That is because their birth rate is low in comparison with their death rate. One never hears of a housing shortage in Iceland or Siberia. One does hear of them in England and America. America, however, never had any problem until the war.

Shortage of 2,000,000 Houses

ENGLAND'S housing problem is so serious and has existed so long that everybody concedes that private enterprise cannot solve it. Everybody concedes that the government must build houses. *Every political party in England, when it has been in power, has built houses.*

The Shaftesbury Act, passed in 1851, required local authorities to build lodging houses for the working classes.

The Torrens Act, in 1863, required local authorities to demolish or repair unfit houses.

The Cross Act, in 1875, put a little more pressure upon local authorities.

The Finance Act, of 1909, empowered local authorities to undertake extensive building and town-planning schemes.

The Addison Act, of 1919, directed local authorities to draw up housing schemes, submit them to the ministry of health for approval, and proceed to construction.

Under these various acts, about 400.000 houses were built that are still habitable. England would now have enough houses were it not for the fact that population has increased more rapidly than houses were provided. Builders came nearer to meeting the birth rate a hundred years ago than they are now. During one of the decades between 1801 and 1841, building rose to 188 houses to each 1,000 houses that existed. Between 1841 and 1891, it sank as low as 116 to the thousand. There was a little recovery between 1891 and 1911—the rate rose to 149 to each 1,000—but from 1911 to 1914 it fell and during the war it stopped.

The British Isles are now short 2,000,000 houses. This shortage is steadily increasing. The Labor government estimates that it will have to build 2,500,000 houses during the life of its building program to give every family a home of its own. Some British families are now crowded together like cattle in a car.

Appalling Infantile Death Rate

YOU do not wonder when you realize how rapidly population is increasing. In 1901, England and Wales had a population of 32,527,843. In 1921 they had 37,885,242. During the ten years from 1891 to 1901 they had 2,394,195 marriages. From 1911 to 1921 they had 3,075,903 marriages.

The full weight of the housing shortage has fallen upon the working class. There has been not only discomfort but death. Children have a poor chance to live. In Bradford, England, houses so poor that each is taxed only 6 pounds a year, the infantile death rate is 163 to each 1,000 born. In houses good enough to be taxed 8 pounds each a year, the death rate drops to 128; a 12-pound tax means a 123 death rate, a 15-pound tax, a death rate of 88. You realize what these figures mean when you are told that among the prosperous, the infantile death rate is only 44 to each 1,000.

The Addison scheme was the most pretentious project that had been suggested by any government until the Labor party came in. It was directed by Dr. C. Addison, minister of health in Lloyd George's coalition government who resigned and joined the Labor party after the project was halted by parsimonious politicians in the summer of 1922.

Under the Addison plan, the national government bore the cost of building houses, though local authorities participated and local property was taxed a penny to the pound.

The Addison plan produced, up to December, 1921, 102,369 houses and when work was stopped in the summer of 1922, 74,000 houses were in process of construction. Building was stopped because the business interests contended that the revival of trade was being prevented by excessive taxation. Sir Eric Geddes was appointed to cut off all "unnecessary" expenses. Geddes apparently considered houses unnecessary.

> The weakness of the Addison plan lay in the fact that building rings found it possible to take advantage of it. Dealers in materials doubled their prices. There were actually built fewer than a fifth of the houses that the plan contemplated and these cost so much that workingmen could not afford to rent them. Each Addison house cost 1,000 pounds to build. A few months after building ceased, the cost had dropped to 500 pounds.

The Chamberlain housing scheme of 1923 was wrecked on the same rock. Profiteers did it to death. Bricks went up 228 per cent; firebrick, 327 per cent; scantling, 226 per cent; lead pipe, 155 per cent, and all other materials to a greater or lesser extent. Construction was carried on through the local authorities who were required to use private builders. The houses erected were poor and small. Each house cost 375 pounds of which 6 per cent went for land, 40 per cent for materials, 26 per cent for labor, 13 per cent for roads and sewers, and 10 per cent for the builder's profit.

The Labor plan, which is known as the Wheatley scheme, inasmuch as it comes under the minister of health, strikes hard at the evil that has either wrecked or impaired the efficiency of all other housing measures. *Profiteering is made punishable by a fine of 100 pounds or three months in jail—or both. If it be a corporation that is convicted of profiteering, the chairman of the board and every officer connected with the company's management is to be sent to jail unless he can prove that he had nothing to do with the attempt to fleece the government.* The burden of proof is thus placed upon the accused who is assumed to be guilty. The bill also seeks to give the government power to take over and operate plants in which building materials are produced until such time as it shall consider that profiteering will not be continued by private owners.

Must Build or Resign

THE Wheatley plan provides that the government shall appropriate 500 pounds for each house built. The money is to be paid in during a 40-year period at the rate of a little more than nine pounds a year. Critics of the plan say that its weakness lies in the fact that no houses at all can be built unless private bankers are willing to advance money on government paper. Builders and workingmen must be paid on the spot. The Labor government believes the bankers will come across.

The bill is not yet a law but the Labor government is making a determined effort to put it over. Moreover, MacDonald will not stand serious interference. If the bill be emasculated in the Commons, he will resign. Resignation means going to the country for a new election. MacDonald's opponents do not want him to go to the country for a new election on anything so dangerous to property interests as a housing problem. They fear he might come back, not with a minority government such as he now has, but with a clear majority over all.

So the tactics of the opposition are cautious and crafty. Last summer they voted that the bill should be considered by a committee of the whole house instead of by the committee of fifty or sixty members that would ordinarily have threshed it over. The Labor government resisted, but had to yield. It lacked the votes to work its will and the issue was not serious enough to justify resignation. But the housing bill will be passed, substantially, in its present form, before the end of the year or the Labor government will resign and there will be another election.

Mr. Wheatley, the Labor minister of health, whose duty it is to jam the measure through the House of Commons, has been a great deal of a surprise to the old-school politicians and the vested interests of England. Until he went into politics, he ran a stationery store in Glasgow. Nobody who did not know him ever dreamed that he could keep up his end in a debate in the House of Commons. But he can.

A Vicious Howl

A FEW paragraphs from a speech that he recently made in the Commons show what he can do.

"It is unnecessary," he said, "to emphasize the fact that if the great toiling multitude of this country is getting down to a condition of greater and greater slumdom, it is an alarming situation. I remember that on a former occasion when I was addressing the house, and I was moved to refer sympathetically and pathetically to the conditions of these people, my speech was referred to as 'sob stuff.' Therefore, today I will not indulge in sob stuff. I will not be guilty of what was an offense then of assuming that conservatives have souls as well as pockets."

This brought a vicious howl from the Tory benches. Wheatley went on:

"This afternoon I am going to talk to them pocket politics. I am going to remind them as the representatives in this house of the great industrialists of the country, dependent for their supply, in the main, on the people who live under these poor housing conditions, that they have entered upon the keenest industrial competition in the history of this country, and that their success in the competitive markets of the world depends to a large extent upon the maintenance of an efficient British working class, and to urge them, for the sake of their pockets, to recognize that it is impossible to produce, in the housing conditions of today, workers who can successfully compete in the world's markets of tomorrow."

Here the Labor members interrupted Wheatley with cheers.

A feature of Wheatley's plan that has received a great deal of consideration is its cost. To build 2,500,000 houses at 500 pounds each would seem to mean an expenditure of 1,250,000,000 pounds, or, expressed in dollars at the current rate of exchange, about $6,625,000,000. The Tories say the Wheatley plan would cost 2,000,000,000 pounds. Wheatley does not seem to be much concerned about cost—he wants the houses. Replying to criticism one day he said:

Intelligent Selfishness

"I NOTICE that statistical maniacs have been totaling up the sum that will be required to give us 2,500,000 houses at 500 pounds each and they say the nation cannot afford all that money. May I remind these financiers that whoever builds the houses will have to expend the same amount of capital, while it may cost the government considerably less if they are erected under the control system that we have proposed?

"As to the annual expenditure which I believe at the peak will be 34,000,000 pounds, it seems, when you work it out, to be a terrible sum, but *it is just one per cent of our national income,* and if we cannot afford one per cent of our national income to remove what is really a cancer in the heart of our community, then we are not worthy of the income that the blessings of modern society are placing at our disposal. *This sum, even at its peak, is equal only to ten per cent of the national drink bill."*

Even if the Labor government should get its housing program through Parliament, as it expects to, it will have no rosy pathway ahead. The building trades of England have languished so long, for lack of work, that tens of thousands of skilled mechanics have flown to other shores—particularly to the United States. *In 1901, there were in the building trades of England and Wales, 720,229 skilled workingmen. Now there are only 365,596. Apprenticeship has disappeared in masonry and is disappearing in bricklaying.* Young men do not care to take up a trade that means a little work one year, not so much the next and emigration the third.

The building trades, however, have confidence in the Labor government and have agreed, if fifteen years' of steady work are pledged, to recruit their forces to whatever figures may be required to put up the houses. Moreover, they have promised to keep wages where they are, provided the cost of living remains where it is. They say there will be no profiteering on the part of labor. Wheatley believes that intelligent selfishness, if nothing else, will cause the building trades unions to keep their word. He purposes to hold over labor, throughout the building program, the club of a suspension of all activities if wages be increased. A breach of faith on the part of labor would mean no wages at all, because there would be no work.

Weary of Slumdom

THE Labor government is in a position where, if it be authorized by Parliament to proceed, it must prevent profiteering, both by capital and labor, or fail utterly. It would do no good to build houses that workingmen could not afford to rent. Costs must be kept down. Wages in the British Isles are low. Workingmen must live in houses within their means. That is what is the matter with the houses built by former British governments. Owing to profiteering, they cost too much. Most workingmen cannot afford to live in them.

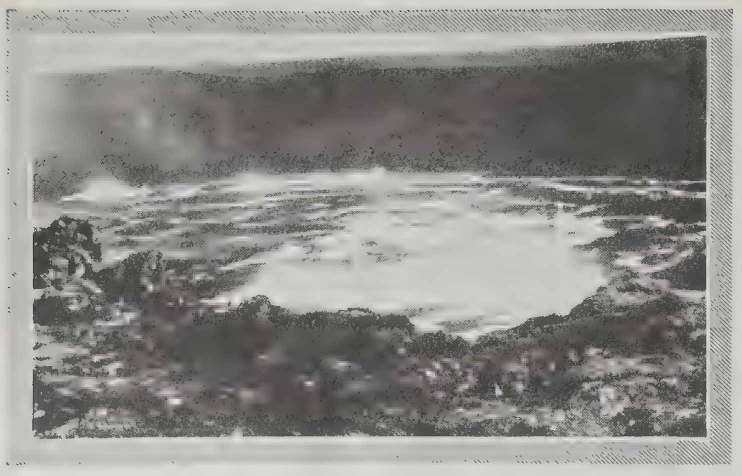
It is, therefore, difficult to exaggerate the importance of the Labor government's housing problem, not only to the British Isles, but to the rest of the world. If the plan shall be given a chance, and shall succeed, the prestige of Labor will be so enhanced that it will remain in power a long time. The rest of the world should be interested in that. As long as Labor controls England, peace will have a better chance throughout the world. English workingmen will not attack anybody or play a game of high politics that might lead them to the slaughter. Nobody would be as safe if MacDonald were out of office and, say, Curzon or Churchill were in his place.

But MacDonald must build houses if he is to remain in office. The working classes of the islands are tired of being packed into crowded quarters. They are weary of seeing their children die because they cannot have fit places in which to live.

Safety Valves of the World

Globe Would Explode Like an Over-Charged Boiler Without Volcanoes

By HARRY H. DUNN



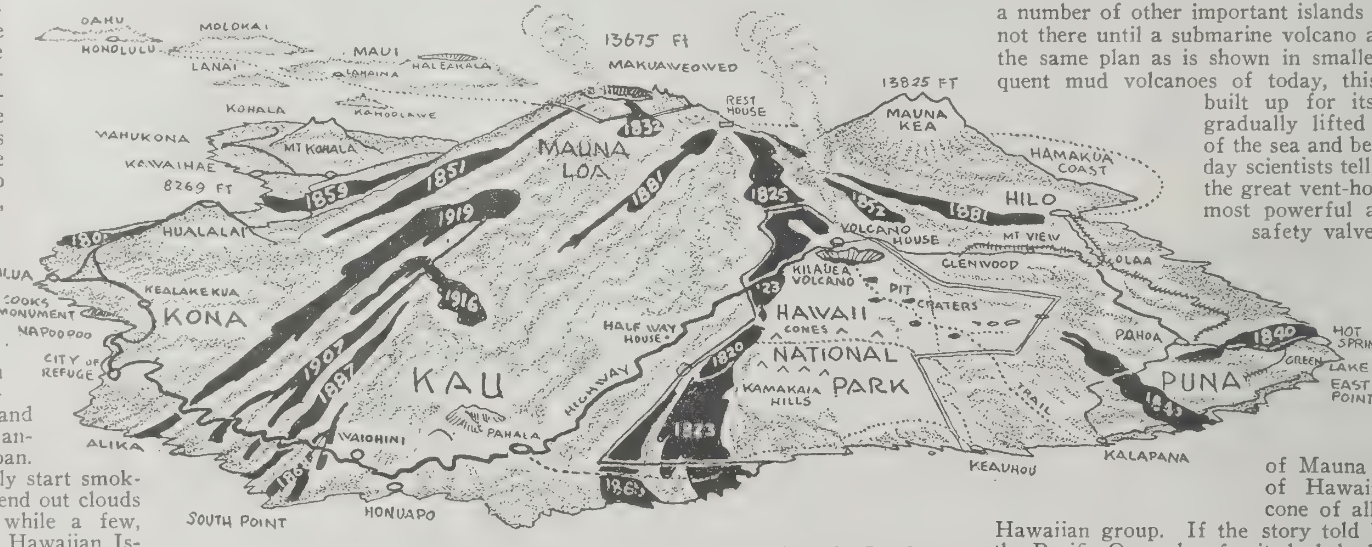
Halemaumau, the central vent of the safety valve of the world, 500 feet across and 65 miles deep (estimated), an immense natural pot of molten lava, kept boiling by the intense heat of the interior of the earth. This photograph was made late in the evening, and shows the cauldron of flame which prevents the globe from exploding.

VOLCANOES, regarded since prehistoric days as useless destroyers of man and his works, really are the safety valves of the world. Every time they burst into eruption, they save a part, possibly all, of this old earth from blowing itself into dust, carrying with its fragments all of its burden of cosmically microscopic humanity.

This is the latest idea of science, as worked out by geologists, seismologists and volcanologists, regarding volcanoes, the fireplaces of the god Vulcan, of the ancients. First glimmerings of the theory, which is now being accepted by many scientists and tested out by observation by others, among them geographers and astronomers interested in the career of this planet, came when the records of a number of years showed that when one volcano begins an eruption, virtually all the others, in all parts of the earth's surface, show signs of similar activity within a short period of time.

Thus, when Vesuvius, Etna, Stromboli, or any of the other peaks of flame in the Mediterranean group commence to erupt, the disturbance spreads to craters along the Aegean; then to Colima in Mexico, Bogoslof in the bleak Aleutian Islands, Kilauea in the Hawaiian Islands, mighty Chimborazo in South America, Popocatepetl in Mexico, and even some of the ancient craters of Japan. Many of these merely start smoking, some of them send out clouds of gas and ashes, while a few, notably those in the Hawaiian Islands, send lava boiling over their crater walls. The layman's idea of these volcanoes is that they are deadly to life, destructive to property, and should be plugged, even though, like the mice who sought to bell the cat, it might be difficult to find the man to put in the plug. Science, however, replies that, though the eruptions may kill a few thousands of persons and destroy a few towns, if there were no volcanic vents, and no eruptions from these craters, very soon there would be no world. Man, and all his works, say the scientists, is riding on a huge globular tank, filled with superheated steam at undreamed-of pressures and highly compressed and deadly gases. The walls of this tank are approximately sixty-five miles in thickness, and the molten "magma," or interior, not only is held rigid at the pressure forced on it by this sixty-five mile shell of earth and stone, but is maintained at a constant heat of 1,000 to 2,000 degrees Centigrade. The earth is shrinking, as it cools, and, as it shrinks, the pressure on this superheated interior increases. Like an overblown toy balloon, it would burst, were it not for the pin pricks in its shell which we call volcanoes.

Geologists of several western universities, with their special opportunities for studying at first-hand the far-flung ring of volcanoes which girdles the Pacific Ocean, have developed this idea to its present status. Professor T. J. J. See, captain of nearly a quarter of a century's service in the astronomical and mathematical departments of the United States Navy, and now in charge of the naval observatory at Mare Island, California, has shown that the tremendous pressure at the bottom of the Pacific Ocean—more than six miles deep in some places—is sufficient to force the water through all the intervening earth and rock, into the incandescent heat of the interior of the earth, thus adding fuel to the already almost inconceivable pressure and power restrained there. Indeed, some scientists now believe that, if all the other volcanoes were to cease operation, those on the Hawaiian Islands, including the most persistently active craters known, would release sufficient water vapor, gases and lava to prevent the pressure within the earth going beyond the power of the earth's crust to restrain. If this be true, it means that the Hawaiian volcanoes are the real safety valves of the world; the "pops," as engineers call such valves, which, when the pressure prepares to blow us all up, let go with a roar heard round the world, and save the globe from explosion, just as the safety valve on a boiler releases the steam when the pressure rises beyond the retaining capacity of the boiler walls.



Relief map showing the "safety valve" of the Pacific with its several vent-holes, on the large island of Hawaii, with the other islands and their respective craters and cones in the distance. The dates at which fiery streams of molten lava have flowed out of these safety valves, and the extent to which these streams of fire fresh from the interior of the earth have flowed down the volcanic cones, is shown in this map.

The great Pacific Basin—as scientists call the ocean of that name—is the largest and most numerously cratered volcanic field in the world. There are hundreds of active, and thousands of inactive, volcanic cones around its shores, and more than 2,500 volcanic islands in its waters. But nearly all the mainland volcanoes, from Australia up through the Philippine Islands, along the coast of Asia, through the Aleutian Islands and down the west coast of both Americas, have gone out of business in favor of the huge craters on the Hawaiian Islands. It is a mistake to call any volcano "dead" or "extinct," even though all its vents are plugged and its cone caved in so as to fill the crater. For no volcano known today is definitely dead, or out of such condition that, at any moment, it may start an eruption, its activity or inactivity depending entirely on the ability of the other volcanoes to discharge the excess pressure from the heated interior of the earth.

Geology shows that from the Cambrian to and through the Paleozoic ages, the surface of the earth was dotted with volcanoes as thickly as the rind of an orange is covered with pores. At that time the heat in the interior of the globe was greater than now, but the pressure was not so great, contraction had not proceeded to its present point, and the crust or "skin" of the earth was considerably thinner, so that volcanic vents were more easily formed. And, by the way, the exact method of formation of a volcano is not known, except in the cases of the fissure volcanoes, notably in Iceland, where lava has poured from cracks in the rocks even within historic times. It is supposed, however, that volcanoes appear where the crust of the earth is relatively less solid than in other sections, so that the pressure, seeking as always, the weakest point in the force which restrains it, breaks forth at that spot.

This accounts for the formation of the world's safety valve in the Hawaiian Islands, or, to be geologically correct, for the formation of the Hawaiian Islands, and many other islands in the Pacific, by the action of submarine volcanoes. The shell of the earth beneath the Pacific Ocean is relatively thinner than it is in any other part of the world. The Nero Deep, for example, near the Island of Guam, also known as part of the Marianne Trench, is 5,269 fathoms, or approximately six miles, deep. Mount Everest, the highest projection above the surface of the earth, could be upended in this pit and still have nearly a mile of water over its base. The area of the Pacific Ocean, roughly stated, is forty million square miles. Of this, at least thirty million square miles are covered with water from 2,000 to 3,000 fathoms (12,000 to 18,000 feet) deep. There are 2,250,000 square miles which are covered with water to a depth of more than 18,000 feet or, roughly, three and one-half miles. There are half a dozen "deeps" and "trenches" now charted in the Pacific whose depths exceed 4,000 fathoms, or 24,000 feet, nearly four miles.

This depth of water, of course, reduces the thickness of the earth's crust by just so many miles as the water is deep. This condition has two results: first, it enables the water, driven by the tremendous pressure above it, to penetrate to the highly heated interior of the earth; and, second, it presents a comparatively thin spot in the crust of the earth for the escape of the gases and molten metallic substances from the tremendous pressure which keeps them rigid in the magma. It is estimated, though how accurately cannot be stated, that the pressure sixty-five miles below the surface of this globe is approximately 176,000 pounds a square inch. When it is remembered that 180 pounds is high pressure for the best steam boiler, the tremendous force which creates volcanoes and maintains them in eruption may be better understood.

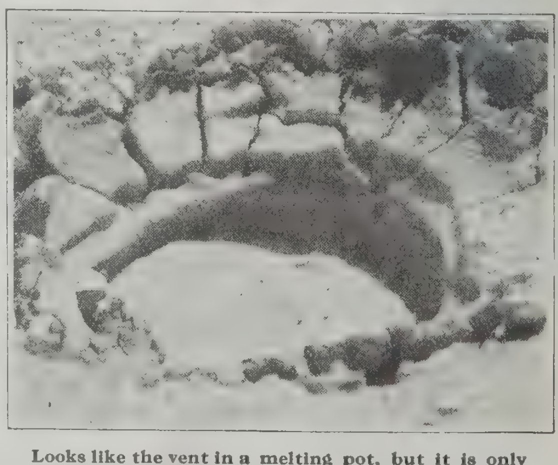
The Hawaiian Islands, some of the Philippines, and a number of other important islands in the Pacific were not there until a submarine volcano appeared. Then, on the same plan as is shown in smaller scale by the frequent mud volcanoes of today, this submarine crater built up for itself a cone, which gradually lifted above the surface of the sea and became an island. Today scientists tell us they have found the great vent-hole of the world, the most powerful and most necessary safety valve of which man has knowledge, in the always boiling, smoking, erupting, molten lava pit of Kilauea, on the slopes of the gigantic volcano of Mauna Loa, on the island of Hawaii, largest volcanic cone of all the islands of the Hawaiian group. If the story told by geology is true, the Pacific Ocean has for its bed the lid of a tremendous melting pot, a pot which is this world, filled with gases under such great pressure that they are rigid, and with solids held at such terrible heat that, like the gases, they are ready for expansion and explosion at a rate almost unimaginable.

So gigantic is this melting pot, and so powerful the forces held within it that, in times past, no single vent could relieve the pressure from within. Thus, the Pacific Ocean has been ringed all round its borders with a vast irregular chain of the largest volcanoes in the world. Beginning with the newest volcanoes in the Aleutian Islands, the chain runs through Alaska, British Columbia, the Cascade and Sierra Nevada ranges in Washington, Oregon and California; the Sierra Madre of Mexico, the Cordillera of Central America, the Andes of South America, and, probably on down into the "dead" peaks of the Antarctic continent, such as the mountains Erebus and Terror. Then back up the western shore of the Pacific, through Java, Sumatra, the Philippines, Formosa, Japan, the Kuriles, the Kamchatkan Peninsula, and around to the lonely Aleutians.

But even these were not enough to save the world from destruction, and, out in the middle of the vast Pacific Basin, where the water at that time probably was at least 30,000 feet in depth, the great power re-

(*Concluded on page 14*)

The largest boiling lake in the world, near Drakesbad, California. This is the crater of an old volcano, and the water is boiling hot at all seasons of the year.



Looks like the vent in a melting pot, but it is only one of several million "mud pots" scattered over the face of the earth, each helping to save the globe on which we live from destroying itself by internal combustion.

Mr. Ford's Page

INDIFFERENTISM is responsible for more harm in the world today than almost any other factor. There are some who do not hesitate to say that it is the principal obstacle to progress of all kinds. What is indifferentism? The dictionary defines it as a "systematic want of interest or earnestness, especially regarding what is true or false." This is a fairly good definition.

A systematic lack of interest or earnestness cannot fail to be destructive; it is bound to kill all laudable ambition, all faith, all hope, all charity. Interest is necessary if the human intellect is to take hold of anything; earnestness is just as essential if the intellect is to be employed to the fullest extent.

A man who is not in earnest carries no weight. Neither his words nor his actions attain any value. He is merely beating the air and plowing the sand. But if he is in earnest, in other words, if his actions are sincere, he will at least command attention. If his actions are built upon a good foundation, his success is certain, and even when his judgment is at fault his shortcomings will be overlooked owing to his manifest sincerity, so that even his most hostile critics will respect him.

> *INDIFFERENTISM is probably responsible for more of the troubles that afflict the world today than any other factor. It is at the root of all failure and of all that is lacking in good citizenship. It is indifferentism in regard to the welfare of the nation that keeps so many voters away from the polls at an election time; it is indifferentism as to the administration of good government that encourages lawlessness. Indifferentism is intellectual anarchy. Its opposite is earnestness, the greatest asset of Lincoln and other men who have made this country great. It is earnestness and sincerity of purpose that imparts the driving power to any enterprise, large or small; it is indifferentism that clogs the wheels. It is the greatest enemy of progress, a more powerful and insidious foe than open hostility, because it appears under so many disguises that it frequently passes unrecognized.*

The man who is not in earnest is like a paper boat which a child has launched upon a pond or stream. On the pond the frail craft, without sail or rudder, will drift with every wind that blows, while on the stream it will be carried along by the current without power to keep itself from being stranded or wrecked.

Lincoln's greatest strength as an orator lay in his intense earnestness. The people knew that he was sincere, and he swayed them accordingly. The people knew that he meant every word of what he said, and that his actions were guided by the same honesty of purpose.

On the other hand, take a man who is not in earnest. No matter how flowery his language may be or how many "gems of oratory" he may flash in the faces of his hearers, his words will not carry conviction.

There is a subtle psychological something by which the average man or woman can tell when a person is really sincere and when he is not. The speaker may possess the eloquence of a Demosthenes, the learning of a Cicero, or the forensic ability of a Mark Antony, but this will avail him nothing if his words do not bear the stamp of truth.

But there are times when the purveyor of words, the mere peddler in flowery phrases, obtains an ascendance over his audience, and that is when the listeners have been smitten by indifferentism. They have come there not to search out truths or to weigh words, but to be entertained. The subject matter does not interest them in the least, but they have heard that So-and-so is a great speaker, and they want to be able to tell their friends that they have heard him; that is all.

Indifferentism degrades a man. By it he is sometimes reduced to the level of something inanimate or invertebrate. But even a clod gives forth its substance to nourish plant life, a jellyfish will navigate its way through rough water and smooth, and an oyster at least knows how to take care of itself.

Some of the lower animals display an earnestness and singleness of purpose that is a lesson to human beings. Take birds, for example. Their yearly cycle of duties is performed with a full measure of conscious responsibility. There is no indifferentism in their daily routine. If there was they would perish.

Indifferentism often begins early in life. It usually becomes firmly fixed in the "I don't care" type of mentality. This reiteration of "I don't care" in youth is a sort of perverted Coueism which has a most destructive effect in after years; for the person who is continually using this expression unconsciously becomes inoculated with the microbe of indifferentism. It is a malignant disease not only for the person directly concerned, but for the world at large.

Another form of this malady is embodied in the oft-repeated phrase "Never mind." You may venture to point out to a man that he is taking the wrong means to accomplish his end, and he will say, "Never mind"; you may warn him that there is a storm coming when he is starting on a canoe trip and he will answer, "Never mind": and so the storm comes and there is one more victim of indifferentism.

One thing about the "Don't care" type of man is that he deceives no one; he does not even deceive himself. It is a piece of bravado that will not pass. It is a flimsy bit of counterfeit; a pitiful piece of bluff.

It has often been said that the bravest man is he that fears a danger but faces it. He confronts peril without flinching because he knows it is his duty; because he is in earnest. The bluffer may approach the trouble with an outward show of confidence, but he is more liable to panic should anything unexpected happen.

Indifferentism is the bane of the world today, and shows itself in a multitude of ways. A gigantic wave of indifferentism is the main obstacle to the efforts of those who are trying to make prohibition an impregnable bulwark in this country. Look at the indifferentism of those who are called upon to put their strength into some movement for the public welfare. They will stave it off by remarking, "This is none of my business; this matter does not concern me," ignoring the fact that all that is for the good of their fellow men is for the good of themselves.

Indifferentism is, therefore, another name for selfishness. Were selfishness once to get a firm hold of the world, it would mean the end of Christianity, and with Christianity would perish the precious quality of unselfishness. Indifferentism predisposes a man to "pass by on the other side," but unselfishness makes him the "neighbor" of those who lie bruised by the wayside.

Crowds stand by while fellow creatures are drowning, but unselfishness is ever ready to attempt a rescue. Indifference leads to sordid incapacity, earnestness to efficiency and service.

The most fertile cause of accidents is indifferentism. Through it buildings collapse, trains are wrecked, lives are lost. Careless workmanship, neglect of duty, the "let-it-go" sort of attitude form the foundation for all kinds of trouble. Wherever indifferentism prevails in regard to ethics it almost always exists in regard to things material. Carelessness dulls the intellect, paralyses the energies, and clogs the actions. "A sound mind in a sound body" is an age-long axiom. That which we call stupidity arises from indifferentism as much as it does from sloth or lack of intellect.

Ideas which if put into practice would have played an important part in the welfare of mankind have been lost through indifference. Inversely, many of those things that have been of the greatest benefit have been rooted in alertness.

A farmer passing one morning through a field of grain that had been devastated by a storm saw, amid the acres that had been laid low, one stalk which stood upright amid the general ruin. Had indifferentism prevailed that farmer might have gone on his way without a second glance at the stalk of grain, if he had noticed it at all. But a keen vision was wedded to a sound imagination, the apparently trifling circumstance was noted and from that single stalk of grain was originated an entirely new variety which left all others behind in its vigor and quality.

Big things arise from little things, but indifferentism kills both.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

China and the League

JAPAN and Persia urge that China be given a seat on the council of the League of Nations on the ground that Asia is the largest country in the world, and contains half the human race. According to Holy Writ, Asia was the cradle of the human race, and it was in Asia that all the great developments of the human race had their origin.

The representative of Japan at the assembly of the League of Nations, Viscount Ishii, was most emphatic in his insistence that the time had come for the due recognition of the Asiatic races. He also made the following significant declaration: "In order to facilitate peace and insure the progress of the world it is necessary that the peoples should respect one another. The question of the equitable treatment of foreign nations is a gauge of the evolution of the League of Nations. In the last month the dawn of a new era of peace and mutual understanding has been rising in Europe."

The first thought that arises in connection with this demand is that the East is undoubtedly awakening to the fact that hitherto it has not taken its due share in the progress of civilization. The second is that China is in itself a vast country which is divided into factions and will be kept busy enough endeavoring to acquire unity within its own borders without devoting too much attention to wider issues. It is essential that China should show some semblance of unity before any representative that might be appointed to a seat in the council of the league could be accepted as the mouthpiece of the Chinese nation.

So long as there are Dr. Suns and Marshal Changs and other leaders fomenting civil strife and carrying on their own petty wars or encouraging others to do so, there will be dissension in China. To the request for the admission of China to the council the assembly might well be given the answer which America has given to the European powers who urge her to join the league: "As soon as Europe settles her own differences we shall consider the matter." Internal strife in China is not a recommendation for a seat in a body which has the task of adjusting the disorders of other nations.

Some Things Necessary

THAT time-honored slogan, "Back to the land," is once more making itself heard in England. R. O. Wilson, in the *Nineteenth Century,* thus comments on the circumstance:

"From the country places a tide of humanity flows steadily toward the cities, to some extent, perhaps, drawn on by the arc-lamp moons that rule the night of the latter, but certainly set in motion and partly sustained by economic forces. We profess alarm. 'For strategic reasons England must produce its own food supplies,' says one. 'The physical fitness of our race is endangered,' exclaims another. Most of us concur in bidding the tide draw back, but our efforts to stem it seem to have resulted, hitherto, in little more than the popularizing of a few catch-phrases.

"If rural depopulation threatened nothing but our national security and physical welfare, then perhaps we need not worry about it overmuch. We might let the countryman go—let him build greater factories instead of greater barns. Athletics, personal hygiene, and the healthier conditions resulting from town-planning and modern sanitation should suffice to keep the race physically fit."

But the writer points out that man cannot live by bread alone—or even by bread and gymnastics, because in these modern times the tendency is to misuse our emotions rather than our muscles—and he asks: "Will they ever be able to synthesize transitory excitements and ephemeral pleasures into abiding joy?"

It is to be feared that the precious jewel of contentment cannot be produced in the manner thus indicated. Improved highways and the great advance in transportation facilities have certainly brought the town and the country closer to one another, and this has undoubtedly begotten a better understanding between the two; but the cities are very much what the people make them, and the same applies to the country.

On the one hand we have those who cry: "Let us go to the city, the country is too slow," and on the other there are those who shout just as loudly: "Let us get out of the hurry and bustle of the big town, and go where the pastures grow green and the birds sing." But neither England nor any other country will find its redemption in either direction if the desire for that which is for the moment unattainable—the longing for things that are incompatible—engenders that feeling of discontent which makes its poor victim a mere Mr. Facing-both-ways, without faith in the present or hope in the future. Adaptability to the conditions under which one is placed—the making the most of things—must be concomitants if the desired end is to be reached.

The Outpost of Prohibition

THE outpost of prohibition is undoubtedly to be found in the Faroe Islands thrust out into the Atlantic off the north coast of Scotland. The Faroese have, among other excellent laws, decreed that the public sale and retailing of alcoholic drinks are prohibited. Only light beer and soda water are obtainable.

Without intention of appearing flippant, it may be remarked that in view of the fact that the staple food of the Faroe Islanders is salt fish, a commodity which they also export in large quantities, there is something heroic in their abstinence from liquors which their forefathers considered indispensable to their well-being. Even salt fish fails to provoke a brand of thirst which some other peoples in other parts of the world find no difficulty in accumulating under less trying circumstances.

It is not that the Faroese could not procure liquor if they wished. Numerous steam trawlers from the big seaports touch at these islands in pursuit of the fishing industry, and trading steamers from far and near amply supplied with "wet goods" of all descriptions put in from time to time. But the men of Faroe, once having adopted prohibition as the best policy even on an isolated group of gray rocks many miles from anywhere, are conscientiously resolved to abide by their decision. The main reason is this: they have found that their health and prosperity have increased with their abstinence.

Work Well Done

NOW that the world-encircling flight is over, airmen are discussing the project of establishing a round-the-world speed record. This appears at first sight to be quite a logical outcome of the splendid results obtained by the intrepid aviators who have brought honor on this country, but it is a project which requires grave consideration.

The perils and hardships which were borne by the early pioneers of travel by land and sea pale before those which the pathfinders of the air have had to endure, and which others will have to endure until conditions are more advanced. The progress made in aerial navigation during the past decade has truly been astounding, but, after all, air travel is still in its initial stages, and much has yet to be done before it takes its proper place in the scheme of things.

Lieutenant Lowell H. Smith, who has been approached as to his opinion on the establishment of a speed record, feels that, although the trip might prove an easier one than he and his companions have just finished, he would not care to engage in such another nerve-wracking enterprise for some time.

No one can be surprised at this. These men have just completed a journey which stands alone in the history of the world, have encountered dangers and distresses such as the pioneers of the past never dreamed of; dangers by mountain and flood, from scorching heat and from biting cold, from wild beasts and wild men, from the elements in all their moods. They want a rest.

The value of the work they have accomplished cannot be estimated. The experience they have acquired and the knowledge they have accumulated will be of the greatest service to those that follow. They have added another and a most notable chapter to the world's history. Their deeds will be spoken of with reverence and gratitude by generations yet to come.

Neutrality All Round

THE Assembly of the League of Nations would have done well to have vetoed any attempt on the part of the countries within its scope to form entangling alliances. The forming of these alliances implies aggression in one direction or another, and is invariably regarded with suspicion by those who are not parties to them. Jealousy and suspicion lie at the bottom of all the bloody wars that have ever afflicted Europe.

The League assembly is already experiencing some of the fruits of its complaisance in the matter of international alliances of this description, more particularly in regard to what is known as "the little entente"—Rumania, Czecho-Slovakia and Jugo-Slavia and Poland. Germany and Russia have formed a pact by which the status of a neutral nation is sought by Germany in the event of her joining the League of Nations.

A glance at the map of Europe will show that in the case of any conflict arising, this grant of neutrality would guarantee Germany from any attack and from any troops of other nations passing through her territory. More than this it would be a protection for Russia along the whole of the German frontier. It also would protect these two countries from France.

The League undoubtedly has its limitations, and one of its limitations is that in its deliberations it is not always a free agent. It is a body the members of which regard one another with a certain amount of distrust, and this undoubtedly reacts in the forming of its decisions. The head and front, the soul and body, the object above all objects of the league is to bring about conditions which will insure the world against war. If it is not working toward this object it is not functioning as it ought.

But let us look upon this neutrality idea on its brightest side. Why not carry it to its logical conclusion? Why cannot the League of Nations pass a series of resolutions guaranteeing one another neutrality? If it can be done in the case of one country, why can it not be done in the case of another? Let a pledge of neutrality be forthcoming for every country belonging to the League. Neutrality all round would be a practical step toward peace, and a mightily effective one.

A Mystery Solved

THE tales told by those who go down to the sea in ships are many and varied but perhaps there has never been a more fascinating story than that of the mysterious disappearance of the crew of the brig *Marie Celeste.* The *Marie Celeste* sailed from New York to Genoa in the year 1872, and after having been spoken by a passing vessel the previous day, she was found drifting in the Mediterranean abandoned by every living creature. The captain had his wife and child on board, and in the dining saloon the table was fully set for a morning meal. There was no confusion in the appearance of anything on the ship; it just looked as if the captain and crew had vanished into the ether.

Many theories have been advanced to account for the strange case of the *Marie Celeste,* and a few years ago several eminent authors had a shot at elucidating the mystery in the pages of a popular magazine. But if the story which has just come to light can be accepted, they were all wide of the mark. After 42 years there has just come a disclosure from a Captain H. Lucy, who is well known all over the Mediterranean, who states that he has the true story of the *Marie Celeste* from a man whom he met in Australia, who was formerly the bo'sun of the ill-fated vessel.

The tale told by the bo'sun, in brief, is that on the day before the *Marie Celeste* expected to reach port, there was sighted a derelict vessel. On this vessel a large sum of money in gold and silver was found, and immediately a scheme was formed, participated in by the captain and the whole of the crew, that the money should be divided in certain proportions, and the *Marie Celeste* abandoned. The crew arrived at the port of Cadiz in boats borrowed from the derelict, the names on which they had changed, and after reporting the loss of their fictitious vessel they scattered to various parts of the world.

The old saying that the truth will out sooner or later seems exemplified in this case. Captain Lucy apparently has no reason to doubt the veracity of the ex-bo'sun. The disclosure completes the last chapter of a story that has taken well-nigh a half-century in the telling.

Resuscitation of Apparently Dead Cities

Beautiful Parks and Stately Streets Appear at Command of City Planner

By HUGH C. MITCHELL

"IS YOUR city dead?" Can you imagine the looks of indignation and surprise with which officials and residents of *any* of our cities would greet this question?

"Far from it!" they would exclaim. "It is alive and growing."

Yes, but how is it growing? Are its streets and alleys—those arteries and veins through which move its very lifeblood—pulsating with even, steady, moving streams? Or are they here and there so constricted as to produce congestion and all its attendant evils? Are its sewers flowing smoothly to the disposal plant? Or are complaints of foul odors and flooded cellars part of its daily life? Do its very poorest inhabitants have plenty of pure water, though they live in tenements marked with the stamp of poverty? Do its areas of recent growth—as its suburban additions—look as if they came there by natural growth? Or do they look as if some unskilled surgeon had fastened them on with ligaments of concrete and steel, careless of all else save that the ligaments hold?

Is your city dead? Or is it growing, sweetly, smoothly, uniformly? Most likely you who think before answering, and are frank, will answer "No" to both these questions, and we will know that it is growing in unhappy fashion, correcting its mistakes *after* they are made, and paying full price therefor, rather than preventing them and thereby avoiding tremendous civic waste.

(C) Fairchild Aerial Camera Corp.

A good example of the city beautiful with streets converging to a common center, which is laid out with ornamental plots and planted with trees.

Only by having carefully prepared plans to control all growth can a city hope to avoid mistakes which affect both the health and the pocketbooks of its people. The foundations on which any comprehensive city plan must rest are briefly described. There must be complete knowledge of the city already existent, and a like knowledge of the territory over which the city may grow.

An architect, to plan additions to a building already in existence, must have that building's plan and elevations, otherwise not only architectural discord may result, but also structural weakness. Few men would think of going ahead with an addition to any building of pretense without first carefully considering the relation of the old to the new—the harmony of outward appearance, the convenience and unity of interior arrangement. Yet, in the vastly larger work of building a city, how often do we see an utter disregard of both these fundamentals.

Unfortunately, in the past, this question of the city plan has been left for the pages of the technical and semi-technical journals, and, in those cities where active work has been done looking toward such development, to a small committee or group of men. While perhaps the actual making of the plan as well as its execution is a matter for the technical man, the question of securing a plan concerns most intimately every man, woman and child in the city.

We may easily see that city planning can be divided into two major parts, or classes, replanning the old, planning the new. There are also other methods of dividing the subject, according to the particular elements being considered, as transportation, housing, and so on.

A permanent street car loading platform, showing street light, car directory board, and red bull's eyes for danger lights.

Of the two classes first named, replanning the old city undoubtedly presents the greatest difficulties, and is the larger problem. Not that planning a new city is not a large problem, for it is a *very* large problem, but in such planning, one may, to use a homely figure of speech, cut his garment to the cloth, while in replanning the cloth is found already cut. And through the growth that comes with age, and through unforeseen development, the city is no longer comfortable in the garment, which is too short here, too tight there, perhaps threadbare and ragged in places. Can it be recut and altered to fit? It is not enough to know of the misfit, nor to have exact knowledge of its size and location, but as one writer puts it, in a memorandum relating to the planning of our largest city: "Before attempting in any large way to exercise deliberate control over *what* New York is physically to become, we ought to have as clear an understanding as we can reasonably get of the answer to the question, never completely to be answered, '*Why* is New York?'"

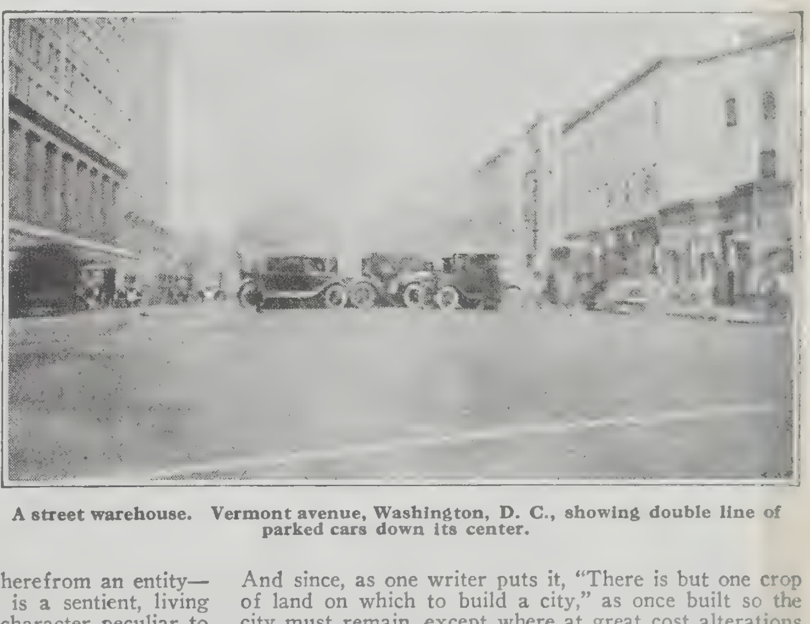
The city planner must know the *Why* as well as the *Is*, and to do this he must go back to the beginning of the city—to its *cosmos*—its *why*, and then step by step trace its growth to its present unwieldiness. He must know its spirit, absorb its greatnesses, analyze its littlenesses—until he feels that he can idealize it, and then applying the technic of his profession to this ideal, evolve therefrom an entity—a practical workable plan. A city is a sentient, living thing, with an individuality and a character peculiar to itself. It has a charm which is all its own, which must not be denied it nor be taken from it.

He who attempts to replan a city, equipped only with a technical mind and mechanical data, must fail to achieve the best results—it will be an accident only if he does not take from it some of its individuality. True, he may relieve congested traffic, plan beautiful parks, or ameliorate unsanitary conditions, and thereby accomplish much good, but if he fails to recognize the spirit which gives the city character, personality, he may hamper the free growth of that spirit, and in the long run destroy it. And so the city planner must ever have this spirit before him, and strive to strengthen it in beauty and grace, as he at the same time studies its traffic problems and analyzes its water supply.

If we go back to its beginning we will find a reason for starting a city in a given place. It may not always be a good reason, nor necessarily a bad one, often just a *raison d'etre*. But back of even that is a big human reason—the community spirit of man—and that is the reason to seek. Men have gathered together for purposes of defense, of barter, of convenience, of society. They have built their homes near each other in a spirit of pure brotherliness—they need the fellowship of others of their kind, and in seeking this fellowship they have selected sites for their homes controlled by a thousand different reasons, and as the city has grown from a crossroads or a river landing it has attracted its people from elsewhere for an equal number of reasons. From such small beginnings have our most complicated cities grown.

It is indeed rare that the planner has the whole cloth from which to work, the planning of an unbuilt city, with full data as to ground and purpose. Our capital city of Washington is a notable case of a city planned in advance of its building, and even its builder failed to foresee sixscore years ahead, and provide adequately for the city of today. Another city which in time may become a classic example in city planning is Canberra, the capital city of the commonwealth of Australia. Here, by act of government in 1908, a commission, with all Australia from which to select a site, placed the unbuilt capital, invited the world to submit competitive plans for the city, selected what it desired from the plans submitted, and proceeded with the building of the city. Here precise surveys were made before even plans were asked for, and the framework of the city as carefully designed and as rigidly constructed as is the framework of our largest skyscrapers. With such data have the builders of this new city planned its streets and boulevards, its parks and parkways, its water features, its transportation lines, its sewers and its water supply. Here, they have said, will be the government administration buildings, and here the legislative group; here are residential districts, and here retail stores. The railway gateway will be placed where it will best serve its purpose, and the wholesale houses have convenient connection with the loading and unloading tracks.

Just as the skyscraper is dependent on the unity and strength of its steel framework for its existence, so the city depends on its framework of streets and boulevards, of transit lines and parkways for its successful being.



A street warehouse. Vermont avenue, Washington, D. C., showing double line of parked cars down its center.

And since, as one writer puts it, "There is but one crop of land on which to build a city," as once built so the city must remain, except where at great cost alterations are made, it is certainly the part of wisdom to plan it not only for present needs, but also for future possible needs, even for future hopes.

Who knows what the future may uncover? Who, in the past, foresaw the needs of today in traffic lanes, required to accommodate thousands of moving vehicles an hour, or of the street space required for storing these vehicles during the working day? Perhaps with prophetic vision born of the mistakes and failures of the past, the city planners of today are seeing the future more clearly. Already they have begun to cease thinking of city planning as such, and are talking of regional planning, even of national planning. They are endeavoring to find room for the ever-increasing numbers of automobiles, and at the same time are thinking of landing places for aircraft. But are they foreseeing everything? I think not. What are they overlooking? Only time can tell, and it won't be bashful in so doing.

Many problems of the city and community we will have always with us. We are continually solving them, to be continually met by new conditions and a call for new solutions. Undoubtedly, the most important prob-

The Marvelous Manipulation of the Mark

How the Goose That Laid the Golden Egg Was Gradually Starved to Death

By WALTER M. WOLFF

This second article of the series explains the results attained by the juggling of German currency.

IN JUNE, 1923, there were 9,300,000.000,000 paper marks in circulation in Germany. By the end of the year this "insignificant" sum had increased to more than 500,000,000,000.000,000,000 bits of nothingness.

Nothingness? Not quite. At all times the vast ocean of paper *was still worth many millions of good American dollars;* in fact, at times the amount of "money" in circulation in Germany amounted to as much as $150,000,000 in real, negotiable value!

The printing presses of the nation were kept clicking at breakneck speed in the race to prevent the production of paper marks from falling behind the mark depreciation on the international exchange. With dozens of paper mills turning out hundreds of carloads of paper for the multitudes of printing presses, the government's policy of depreciating the mark to 0.00 was all but achieved, *apparently.*

Five or six quintillions of paper marks looks as if it ought to include everything, but it doesn't. It ignores some quadrillions of marks issued by German states, cities, towns, villages, banks, firms, and individuals, in many cases without security or limitation. This private money was called "Notgeld," or emergency currency, and ranged in denominations from one pfennig to several marks before the avalanche had arrived. With the sky and astronomical figures the limit, however, "Notgeld" makers found they could add ciphers just as easily as the Reichsbank.

But now we come to the most interesting phase of all. Here is really the key to the entire problem and the explanation in a nutshell for the alleged enormous manipulation of wealth in Germany at the time. Of course, the Reichsbank did not give out credit to German firms promiscuously. Not quite. She took a pittance now and then and raised her discount rates repeatedly until finally she actually charged something like 30 per cent. But the mark depreciated so rapidly that an accurate check on the doings of German industry was rendered wholly ineffective.

Some marvelous results came to the surface—so marvelous, in fact, that if they were not actually true they would sound absolutely "fishy" and absurd.

The Magic of the Mark

FOR example, *a firm which on January 1, 1922, borrowed $50.000 worth of marks, was able to pay them back on December 31 with $1,000!*

But now to the incredible. In 1923, credit amounting to *five hundred million dollars on January 1 could be paid back on December 1 with one dollar's worth of paper marks!* It doesn't sound possible, nevertheless every word of it is absolutely true. Furthermore, it explains why there are so many alleged rich Germans—if not today, then yesterday.

Thus it was that the German industrialists, bankers, public officials, and other "fortunates" came into possession of untold riches. Every person in those days who had a foreign bank account or a reasonable amount of foreign currency in his possession was a made man. And why shouldn't he be? The bank fiat money didn't cost the Reichsbank a great deal and the idea—while it lasted—of extracting real wealth out of the sky and milking the German common people was superb. Like most schemes of a financial nature, it was too good to be shared with the "common fry"—Mr. German Average Citizen. And it all happened so smoothly, so quietly, and so quickly, that the German common people to this day have failed to realize what actually took place entirely before their very eyes.

But "all which goes up must come down," or, in similar American parlance, "the higher they go the harder they fall." One fine day something radical happened; the German inflation stopped. It could go no further. For a long time nobody had been paying any more attention to the ciphers—twelve or more of them on the paper notes—and, therefore, there was really nothing further to be gained from the inflation. The latter was dead from this time on, never again to return.

Where the Profits Went

BUT the German profiteers! how their hearts (if they had any) must have ached when they awoke from their dreams and found that humdrum, normal times had arrived once more. Profits that only yesterday had dropped into their laps like raindrops, now would require weeks and months, yes, *years* of real, *honest,* hard work if they were to be realized even to a very modest degree. The proverbial goose that laid the golden eggs had not, to be sure, been greedily slaughtered; it had been ruthlessly starved to death, which probably accounts for the fact that the "eggs" had been growing smaller and smaller until, finally, the "bird" itself succumbed to the inevitable.

Today we are told with unmistakable clearness and earnestness that Germany has no capital. German merchants and manufacturers are piteously begging for a loan, credit, cash—anything to keep the mills moving. "If we don't get a loan soon, we're lost!" is the universal sentiment.

But where are the enormous profits of yesterday? What has become of them? As has been said before, *the greater part of that wealth is now to be found in the form of substantial factory buildings and equipment, in improved agricultural machinery, in land holdings, in merchant vessels, in canals, in power plants, and, last but not least, in private villas and mansions and parks of the "new-rich."*

Not a little of the results of the incredible manipulation may be traced to neat *private* fortunes in the form of huge foreign holdings of stocks, bonds, property, bank accounts, and the like. If the guilty parties might be made to confess, some beautiful facts and figures would, without a particle of doubt, come to light. The scandal would be so outrageous and shocking that the gossiping material ensuing therefrom would last for years and years—yes, even unto the third and fourth generations!

And now German business men have no ready capital and what they are able to obtain from the banks (which are still in a position to loan them something) is too expensive. But why should these newly rich splurge at the most select watering places of Europe at a time when the heyday for gain in Germany had definitely passed? That's just it; prices in Germany suddenly became ridiculously exorbitant due to the direct reaction from the inflation. Commodities had to be paid for in "dollars and cents," literally and figuratively, instead of in worthless money.

Germany suddenly found herself high above the world market in her prices for almost everything; only yesterday she had been the world's Jersey cow. Stories of the fall of the French franc and the cheapness of living in Luxemburg, Belgium, Italy, Hungary, and elsewhere, drew the German "Inflationsgewinnler," or inflation profiteer, away to sojourn in foreign lands. Of course, German baths and resorts complained of lack of patronage, a condition that was all very natural.

When our German profiteer found that he could get only about fifty cents' worth of value for his dollars in Germany at the beginning of the stabilization period, he preferred to part with them in countries where he was sure of receiving a dollar's worth of value *and possibly more* for every dollar he spent there.

The question has, no doubt, arisen in the minds of many students of international finance: "Why didn't the Allies—France particularly—step in and put a definite stop to this inflation fraud?" Somebody, surely, must have known that fortunes were being made illegally. Where was the Allied control at the time?

If the truth is told, the Allies—in fact, every nation in Europe—were participating heavily in the fruits of the inflation period.

There were never so many "visitors" from all over the world in Germany as were there during the years 1921 to 1923, inclusive. And many an American today will have pleasant memories of the little sojourn among the Teutons when he "lived in the finest hotel for thirty cents a day and sat in the kaiser's box at the opera for less than a dime," et cetera. And then there were the hundred and one reparations, control, military, and other commissions, each with a goodly membership whose chief interest and concern was, perhaps, "How much do you pay for a dollar today?" No, the Allies and their representatives in Germany let well enough alone. "The less said about the matter, the better!" was the sentiment.

But we must say a word about German repudiation of internal debts, in conclusion. The government passed a law just after the adjournment of the old Reichstag which is being fought today far more stubbornly than has ever any other single piece of legislation in the history of the German nation. This law is called the "Drittesteuernotverordnung," or Third Emergency Tax Law, and provides that all public or private pre-war debts—bonds, mortgages, and what not—contracted prior to January 1, 1919, shall be paid *not in full* as they should be, ultimately, but with only 15 per cent of the face value.

Debts contracted after January 1, 1919, must first be converted into the gold value prevailing on the particular day of the contract. Fifteen per cent of the ensuing sum is then considered payment in full of the post-war obligation. Does the creditor obtain his money soon? Yes, in the year 1932, he can collect his debt with interest; that is, he can collect up to *15 per cent* of the original amount; no more.

It seemed such a trifle to the German Government (influenced, of course, by German finance and industry—our aforementioned "Preferred Class") to repudiate the entire indebtedness of the nation with one stroke of the pen, that they simply declared bygones were bygones and 1,000 gold marks were now only worth 150; just like that. Of course, the German people at large, the countless thousands of thrifty investors of yore, got busy and raised a mighty "howl" with the result that today there is a likelihood of the ominous swindle, the Third Emergency Tax Law, being summarily repealed—*if* German promises can be trusted. No doubt, a revaluation of all German internal debts and obligations will, out of sheer necessity, have to take place sooner or later.

The German lawmakers have pretty good eyes; they can see the handwriting on the wall. They know, or are beginning to learn, that no sane German will ever again invest a pfennig in German securities, public or private, unless old bills are squared up and paid in full; that much is certain. No wonder money is tight in Germany today! The people have been robbed of their savings and credit, and the profiteer has his money—his ill-gotten inflation gains—tied up in non-negotiable wealth; that is, in wealth on which he is unable to secure cash due to the poverty of the people.

Repudiation of Debts

BUT it is no secret to the world at large that inasmuch as Germany has practically wiped out her internal debt, she can, therefore, pay considerable reparations. German legislators also know this, and watch them try to make amends by showing that, *after all,* Germany has large internal obligations which must be promptly paid (so that she, Germany, will not lose the last bit of the world's respect which may still be due her).

But the greatest inflation period the world has ever seen is now a thing of the past. Its ill effects will be felt for years but there will never again be another inflation. When the second "great manipulation of national wealth" takes place, the *people* will be on the ground floor when the game starts. There will be no "head start" for the moneyed men, the politicians, and the arch-grafters the next time. When Ramsay MacDonald became British Prime Minister, one of the first things he said in speaking on the reduction of the national debt was, *"I regard two means as dishonest: repudiation and inflation."* When the "next time" comes, the *people* will remember these words.

Illusory Terms in the Diamond Trade

FLAGRANT misrepresentations are being made in diamond advertising, especially by those dealers who appeal to the masses of the people. The high-grade, conservative jewelers, of whom there is at least one in every community, disdain to make impossible claims for their diamonds and other wares. They sell on honor, and that is the only kind of jeweler the diamond buyer can afford to patronize.

The National Jewelers Board of Trade has analyzed and denounced the misrepresentations of certain diamond sellers, the most objectionable of which it lists as follows:

a. Use of the term "perfect (or perfectly) cut."

b. Statements claiming definite percentage savings to the consumer, sometimes up to forty per cent.

c. Use of obsolete fractional weights using minus signs.

d. Use of term "blue white."

The most important of the confusing terms used by advertisers are the words "perfect cut" and "perfectly cut," which create in the mind of the reader (and are used for the purpose of so creating) the idea that the stone advertised is actually perfect, leaving the advertiser a loophole as to the quality of the stone by contending that he referred to the cutting only.

The diamonds offered by certain advertisers are in no way "perfectly cut," the term being used as a catch phrase and not intended to be complied with. The word "perfect" in the diamond trade is used only in connection with the quality of the stone, denoting that it is free from all flaws and blemishes. The words "perfectly cut" and "perfect cut" are not used among diamond cutters, wholesalers or legitimate retailers because a stone that is technically "perfectly cut" is very rarely met with and few honorable people in the trade would certify their stones were "perfectly cut," even if they so regarded them.

The metric carat has been universally adopted throughout the trade for a number of years. Some retail dealers still persist, however, in using the old obsolete factions employing a "minus" sign.

Oxford Dictionary Will Be Great Work

THE so-called Oxford Dictionary, which will be completed either this year or next, will be the realization of an appeal made by Archbishop Trench, Dean of Westminster, to the Philological Society in 1857.

The archbishop urged the society "to undertake the collection of materials to complete the work done by Bailey, Johnson, Todd, Webster, Richardson and others, and to prepare a supplement to all the dictionaries which would register all omitted words and sense and supply all the historical information in which these works were lacking, and above all, should give quotations illustrating the first and last appearance and every notable point in the life history of every word."

Dr. James Murray, later knighted for his labor and scholarship, was the most illustrious worker upon this dictionary. It was his enthusiasm that enlisted the support of the Oxford University Press, which required that he give his personal attention to the compilation. Herbert Coleridge, Frederick J. Furnivall, Dr. Henry J. Bradley were also in charge of the work until they in turn died. Dr. William A. Craigie, who joined in 1907, is completing the dictionary.

There will be ten volumes in all, which will contain more than 425,000 words. The total cost will be in the neighborhood of $6,250,000. The University Press has been helped by many generous donations.

The work now nearing completion is a permanent work; it will never need to be done again no matter how long the language endures. It covers the entire middle and new English periods from 1150 to date, dealing with thousands of words that were in use before printing was discovered, thus vastly complicating its labors though making them of value to the philologist.

The new dictionary will far surpass any dictionary in any language. Grimm's German dictionary, which is yet unfinished though it was begun in 1854, limits itself to words which have been incorporated into the German language since the middle of the fifteenth century. Litres' great French dictionary confines itself to words that have entered the French language since the seventeenth century.

When Four Banks Closed Their Doors

Lewistown, Montana, Experienced Financial Chaos Until Better Times Came

By L. M. WESTON

A farmer's wife tells a moving story of what befell her town, and incidentally shows the value of well-conducted banks.

Lewistown, Montana, was, in 1919, at the height of a boom. The effect of the deflation of money and credit in 1920 was perhaps more disastrous than in most communities. It left Lewistown paralyzed. The article was written before the reopening, June 4, 1924, of one of the defunct banks under a new name. The writer has maintained her faith in the future of the little community throughout its dark days.

SOME years ago, Lewistown, Montana, boasted four flourishing banks; now it has none—the banks committed suicide. In rural communities, bankers usually have unbounded influence, as their advice is generally sought and taken, and their example followed. The small town is fortunate whose bankers are wise and conservative, for they have the power to bring prosperity or adversity to the people they lead.

This little city, without a bank, is ideally located on a swift-flowing creek or river from which the land rises in natural terraces, making wonderful sites for dwelling houses. Within its territory are illimitable stretches of farm lands, whose fertile soil brings forth grains and vegetables unsurpassed by any in the world. Gold, silver and gems are mined from the nearby mountains, while coal mines and oil wells abound in its immediate vicinity. The inhabitants of this favored locality laugh at railroad strikes, or coal strikes, for they raise and produce their own cattle, sheep, coal, pork, grain, vegetables, dairy products and oil, and, therefore, are virtually self-supporting and independent.

After the big wheat yield of 1915, Lewistown had the name of being the biggest little city in the Northwest. Its schools were the best, business was booming, and credit unlimited. The banks vied with one another for patronage. Of course, they did not actually ask people to borrow, but the letters they sent out, soliciting accounts, stated that they were amply able to furnish money to the extent of their customers' needs. The banks could borrow at four or four and one-half per cent, and get ten per cent for loaning their funds. The old buildings were not good enough to house such high finance, so beautiful new ones were built, and the officials received fabulous salaries, entertained lavishly, drove high-powered cars, and—everyone followed the example set by the financiers. Even the city fathers were caught in the mad rush of jazz and display, and spent county and city funds in improvements that would have done honor to a place ten times the size of the modest little town whose destiny they were directing. Cluster arc lights, boulevards, graded roads, new schoolhouses, swimming pools, gymnasium—"Oh! them were the good old times," as the hoary-headed lady said, when recounting the pleasures of her youth.

Then came crop failures. The ranchers borrowed more money. Then came a drought. Some of the ranchers wanted to sell their cattle but were advised by the bankers to borrow money to buy hay instead of allowing the fine herds to go out of the state. "Cattle was sure to be high in the fall," they said, forgetting that the cattle market would not be controlled by the small territory affected by the drought. Credit was still easy, so easy that many confounded it with cash.

Then came the oil boom. There was oil, but not enough to offset the depreciation in prices of cattle, wheat and farm products. After all, the little city was dependent on agriculture, and between drought, extravagance, and market manipulations, the majority of the ranchers were ruined.

The banks soon consolidated, so there were only two for the community to support. Possibly these might have pulled through if the ranchers could have met even the interest on their notes, but that, too, was impossible. They had paid the highest prices for labor and equipment, yet had no power to set a price on their own products, commensurate with their cost. Auction sales were common, and well attended, but those who bought paid with more paper, which was of little use to the banks. Cash sales were held, but were not profitable, as the country people lacked money to buy necessities, and though the debtor's belongings were sold for a tithe of their value, his neighbors were not benefited, but some outsider, who bought for speculation, to sell at a profit when times should be better. Frequently the ranchers were allowed to keep their stock and lands in the hope that they would earn at least the interest on their indebtedness.

A story is told of a man who, before the drought, mortgaged his horses. As the winter progressed and feed became scarcer and more expensive, he went to the bank for a hundred-dollar loan. It was refused. The bank had no more money to give ranchers.

"All right," said the countryman, "the horses are yours as I can't pay the mortgage on them. I was just going to winter them for you, but if you won't buy the feed, I'm not going to stay and see them starve. I'll move off the place, and you can look after them yourself."

The banker paid. He knew the horses were not worth their keep that winter, but thought their value might rise in the spring. He was doomed to disappointment, however.

It was the same story with land and cattle. Both needed care, and if the rightful, debt-laden owners were sent adrift, who would do the work? The farmers had borrowed to increase their herds and their wheat acreage, and the price for their commodities had gone below the cost of production, not to mention the unfavorable weather conditions that had depleted the herds and lessened the yield of grain. They felt the sharp edge of poverty and failure long before the banks realized their predicament. Their city cousins were entertaining lavishly and spending freely while they were wrestling with the problem of buying sufficient clothing to protect themselves from the fierce blasts of winter.

Lewistown proudly called herself the Gem of the Judith Basin (widely known as "Montana's Breadbasket"), but it took her citizens some time to learn that a gem is often lost if the setting becomes insecure. The townspeople did not care if their country cousins were fighting, desperately, debt, low prices, scarcity of labor, and adverse weather conditions—until the banks closed. They thought that country people should be contented to live without twentieth-century luxuries and conveniences, and, like peasants of the Old World, should be satisfied with the same life and hardships endured by their ancestors. They could not understand that country people might enjoy high-powered automobiles, wintering in Florida or California, or feel it a duty to keep their families in town that the children might enjoy better educational advantages. There are many cities, the size of Lewistown, and larger, where these same ideas prevail, but they will eventually awaken, as did Lewistown, to the realization that the prosperity of city and country are interwoven. During the oil boom, the banks in the little western city thought "the country hicks" were scarcely worth considering. One young rancher, after vainly endeavoring to get the attention of the cashier, went home in a blaze of indignation, announcing that he was going to "chuck ranching and peddle oil stocks," as people seemed to consider it such a superior business to "raising grub." Then, the oil bubble burst.

The failure of these financial institutions, with their important personnel and palatial fittings, created a distrust of banks among the adjacent ranchers. They looked askance at the creamery checks, drawn on a bank a hundred miles away, and cashed them as quickly as possible. A hog buyer thought he ought to pay less for the swine on account of the expressage on currency he was obliged to ship in before the country people would sell him their pigs. Most of the ranchers now think that checks and promissory notes are in the same category.

The situation in town is tragic or comic, according to one's point of view. People accustomed to paying by check forget to ask for receipts when paying cash, and, sometimes, are obliged to pay twice.

"I bet I get a receipt for every dollar I pay out in future," remarks one irate gentleman who had settled with his wife's hired girl, only to have her demand her wages again, when she wanted money. There was no check stub to adduce as evidence, so the maid received double for her labor.

"Pretty stiff to pay thirty cents on a hundred-dollar postal order when you want to send cash to headquarters," remarked a fire insurance agent, who felt his profits were being greatly reduced.

The stores are quite deserted as many who had money in the bank to pay their bills are forced to let them run. Besides, the storekeepers cannot afford to "carry" people any longer as they, too, owe bills that must be paid, and there is no money to be had at the banks. It takes a wonderful motion picture to draw a paying crowd, and jewelers, florists, and ice cream parlors rarely find a customer.

But the school-teachers are the most to be pitied. City and county funds are tied up, and they cannot cash their warrants. Many of them are strangers here and board bills must be paid. There is talk of closing some of the fine, new school buildings until the taxes come in.

People say that Lewistown is dead, but it isn't. It is only stunned and half-buried in the mud of adversity.

Passing of the Corn-Husking Bee—By S. R. WINTERS

IS THE corn-husking bee passing, soon to be only a tradition? Modern methods of husking corn in the field, as practiced in the Corn Belt, has doomed the time-consuming method of gathering the corn, hauling it to the barnyard, and then inviting the farmer's neighbors to take off the husks at a popularly termed husking bee. Old-time fiddling, dancing the Virginia reel, and the drinking of cider from jugs are the usual festivities attending such farmers' gatherings.

Above—Finding a red ear entitles the possessor to kiss a girl. Center—Drinking cider from the jug is a custom at corn-husking bees. Below—"Virginia Reel" dance at corn-husking bee.

The United States Department of Agriculture evidently believes that the husking bee will soon be only a memory. This government bureau has staged one of these old-time festivities at its experimental farm, Arlington, Virginia, in which the scenes were preserved for posterity by means of a motion picture film. The fiddle, jew's-harp, and harmonica were in evidence, and to such stirring tunes as "Virginia Reel," "Turkey in the Straw," and "Mississippi Sawyer," a breakdown or barn dance was enacted. The jug of cider, usually found at husking bees, was passed around to the huskers. The first man to find a red ear of corn, according to tradition, is entitled to kiss a girl, and this scene, too, was faithfully reproduced at the government experimental farm.

The passing of the corn-husking bee likewise spells the doom of the old-fashioned bone peg used for taking the husks off of corn. A metal ring or peg, invented by a man who lost one hand in a threshing machine, is taking the place of the make-shift bone peg. By means of the latter, a corn-grower in Iowa or other state in the Corn Belt is enabled to husk 247 bushels of corn in nine hours. The corn is taken from the standing stalks in the field and livestock is then turned into the field to eat the fodder, stalks and loose grain.

So, according to the title of a motion picture film of the United States Department of Agriculture; the "Corn Belt Derby" is destined to displace the popularity of the corn-husking bee. The former, too, has its popular features. Notably among these is the contest between huskers who demonstrate their skill and rapidity in harvesting corn. These contests may develop into state and even intra-state rivalry. The Motion Picture Division of the United States Department of Agriculture made a motion picture of one of these contests near Des Moines, Iowa.

It is estimated that one-third of the labor used on farms in the Corn Belt section or Middle West is necessary by reason of the old practice of harvesting corn in the shocks. The "Corn Belt Derby" and similar contests are encouraged by the United States Department of Agriculture.

Seductive Wiles of My Lady Nicotine

Concluded from page 2

bad tooth which had been extracted, but that she had used snuff on that side of the tongue. In thirteen cases that showed cancer of the cheek, it had been the habit of the patients to hold a quid of tobacco at the spot diseased.

Nose, throat and ear affections are promoted by smoking, according to the claims of a number of clinicians.

Acid dyspepsia is common in habitual smokers. In some cases there is a destruction of the capacity to feel hunger. Anemia is often found among excessive smokers, apparently due to the disastrous results of the tobacco poison upon the digestive system.

The truth is, tobacco lowers the whole tone of the body and decreases its vital power and resistance. This is well shown by the fact that, in surgical emergencies, patients accustomed to smoking have been observed to suffer a great handicap in their chances for recovery. This is doubtless because the poisons of tobacco tax the vital resistance and require the expenditure of power by the liver, kidneys and other organs to neutralize and eliminate the poison.

Physique

Physical measurements of students at Yale and at Amherst brought out the fact that those not using tobacco during the college course gained over the users of tobacco in weight, height, growth of chest, and lung capacity. Doctor Seaver made the tests at Yale University. He found that smokers, though averaging fifteen months older than non-smokers at entering, averaged only 1.4 kilograms heavier than the younger non-smokers, that they were 7 millimeters shorter, and also averaged 80 cubic centimeters less in lung capacity. He found non-smokers to gain during college life 10 per cent more than habitual smokers in weight, 24 per cent more in height, 26.7 per cent more in chest measurements, and 77 per cent more in lung capacity.

Dr. Hitchcock made a similar study at Amherst, and found that non-smokers increased in weight 24 per cent more than the smokers increased; that in height the non-smokers surpassed the smokers 37 per cent in their gain, and in chest girth 42 per cent. In lung capacity there was a difference of 8.36 cubic inches (that is, about 75 per cent) in favor of non-smokers, which was 3 per cent of the total average lung capacity of the class.

The influence of tobacco upon the physical and mental characteristics of 223 college students was studied by Dr. George L. Meylan, of Columbia University, who found that there was a slight advantage in the average measurements of the smokers—due, he believed, to the fact that they were eight months older—but that the average scholarship was lower.

Athletics

Professor Pack, of the University of Utah, found that tobacco-using athletes were decidedly inferior to abstainers. The following points were brought out by his investigations: (1) Only half as many smokers as non-smokers were successful in the "tryouts" for football squads. (2) In the case of able-bodied men, smoking was associated with loss in lung capacity amounting to practically ten per cent. (3) Smoking was invariably associated with low scholarship.

Smokers Versus Non-Smokers

A DIFFERENCE between smokers and non-smokers in athletics was also brought out in a study made by Dr. Meylan, who found that 41 per cent of smokers, and only 34 per cent of non-smokers achieved success in varsity athletics; but that of varsity athletes 56 per cent were smokers, as against 52 per cent of the student body; also that smokers and athletes had lower scholarship records than other students.

Smokers were only half as successful as non-smokers in athletic honors, according to studies made by Professor E. L. Clarke at Clark College.

Connie Mack, the famous baseball hero, made it a rule not to sign up baseball league men who smoked.

Clark Griffiths, as manager of the Washington Nationals, said that "any player who insists on smoking cigarets is through."

The fact that most conscientious athletes do not smoke when "in training" shows that they realize that tobacco is injurious. They little realize, however, how great and how lasting the injury is.

Industrial Output, Business Efficiency

Muscular power begins to diminish 5 to 10 minutes after beginning of smoking, according to a study made by Professor W. P. Lombard, professor of physiology, of the University of Michigan. In an hour, when the cigar was burned, muscular power had fallen to about 25 per cent of its initial value. The total work of the time of depression, compared with a similar normal period, was 24.2 compared with 44.8.

An output study of users and non-users of tobacco in a strenuous physical occupation was made by J. P. Baumberger, Edna E. Perry and E. G. Martin, of the Laboratory of Physiology in Stanford University. The study was made in a large glass-bottle manufacturing plant, which operates 35 bottle-making machines and employs more than 500 persons. It was found that workers who chewed tobacco had a much lower output than those who only smoked, or who did not use tobacco in any form.

That working efficiency is lowered by cigaret smoking in the young is attested to by the fact that in Chicago, according to a bulletin of the Health Education League of Boston, there is a large organization of business men pledged not to employ any cigaret-smoking boys. Business men in many other parts of the country are following their examples, the league states.

Tobacco Leads to Alcohol

The drug effects of tobacco apparently lead to a craving for other drugs, including alcohol. Dr. Alexander Lambert, one of the best authorities in the world on drug addiction, writes that many heavy drinkers who are endeavoring hopelessly to cease their periodic sprees are really cases of chronic tobacco poisoning. This is seen, he says, more frequently among the incessant cigaret smokers than among those who usually smoke a pipe or cigars, and most frequently among those who always inhale their tobacco smoke.

"You cannot break them from their periodic sprees unless you stop their smoking," Dr. Lambert asserts. "They are much poisoned by tobacco, being sensitive to nicotine, and alcohol is the quickest diffusile narcotic they can get hold of to ease their discomfort."

Longevity and Death Rate

A recent study by Dr. Albert H. Burr, on the relation of longevity to sex, is reported by him as indicating that the tobacco habit is "one of the very significant reasons why fewer men than women attain old age."

The New England Life Insurance Company published in 1911 the following data from 180.000 policyholders, covering 60 years: Where the maximum of expected deaths was 100, of tobacco abstainers only 59 died, of rare users only 71 died, of temperate users only 84 died, and of moderate users 93 died. Excessive users were not accepted by the company. We must remember, however, that tobacco users commonly use alcohol also and have other life-shortening habits.

Summary

We see then that tobacco is injurious to the human body. It injures the heart, it disturbs the blood pressure, it poisons the nerves, it hurts the eyes, it lessens resistance to tuberculosis and other diseases, its use sometimes induces cancer, it often leads to the use of alcohol, it reduces muscular power and accuracy, it impairs working efficiency, earning power and athletic power, it stunts the growth of the young, it probably shortens life, it probably reduces fertility, it probably reduces appreciably the vigor of the offspring of the heavy smoker.

In short, tobacco acts as a narcotic poison, like opium and like alcohol, though usually in a less degree.

No question seems to exist as to the harmful effects of the "excessive" use of tobacco. Habitual smokers will generally admit this fact. As to the "moderate" use, it cannot be truthfully said that such use will do more than moderate damage.

Because of individual variations, the line separating "excessive" from "moderate" is an elusive boundary, and there is always a tendency toward increasing the use; "moderate" use seldom stays moderate. From every indication, it behooves the man who wishes to keep physically fit to omit tobacco from his daily schedule.

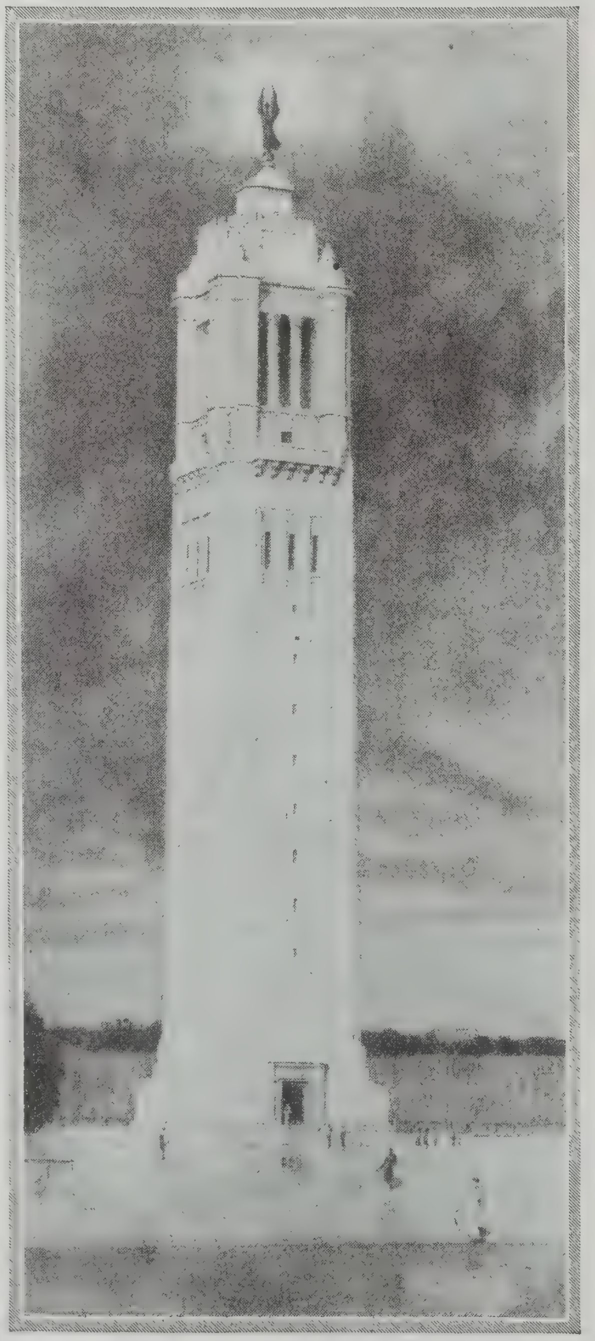
(The mental effects of smoking, and a review of the reasons why men smoke, will be presented in the next article.)

A National Peace Carillon for America

By UTHAI VINCENT WILCOX

BELLS have long been associated with mystery and have even acquired a kind of sacred character. In olden times, and even now in some countries of Europe, the new bell is consecrated by appropriate ceremonial. Many believe that the ringing of these consecrated bells helps to disperse storms and pestilence, drive away enemies and bring good influences.

Plans are now completed which recognize the place of the bell in the national life of this nation. These plans will give to America a great carillon far surpassing the great carillons of the Old World. It will be erected at Washington. As is usual when this country accepts an idea, be it new or old. it will immediately plan to make the reality either the biggest or the greatest or the most gorgeous. America wants the best.



National Campanile was designed by Paul P. Cret who also designed the famous Pan-American Building.

The design of the National Campanile is typical of the nation. It consists of a great tower 360 feet high, rising from a 60-foot base. It will be built of white marble with colored stone for contrast effect. The whole is designed by Paul P. Cret who created the famous Pan-American Building that many aver is the most beautiful public building in the United States. He also designed the granite arch at Valley Forge.

This great shaft of white and colored marble, while simple in design, will be a thing of beauty and pleasure to the eye. The playing of the bells will make it an equal pleasure to the ear. Equipped with fifty-four musically perfect bells, it will be capable of playing any sort of music from simple hymns to Chopin or opera. It will lend itself to great holidays and the expression of the feelings of the nation in the times of public rejoicing and national sorrow.

This great carillon is to be a memorial, dedicated to peace among men and to the ideals of liberty and justice. That it may be truly national in scope there will be a bell for each state and special bells for other memorials. The state bells will be dedicated and inscribed with the coat of arms of the state.

The largest bell will weigh ten tons, and will be called the Bell of the Allies in honor of the nations recently associated with America. This great bell will be tuned to E flat. When men from these nations visit Washington, symphonies in this key and played on this bell will be given.

Ascending in the chromatic scale will be the bells of the states. The smallest bell will weigh under twenty pounds and be pitched to A flat. With the fifty-four bells there will be a range of four and one-half octaves. Each bell will be carefully cast, tuned to a single vibration, and will have five tones—the main tone, three overtones and one undertone. Thus with 54 bells there will be 270 tones that are perfectly matched.

To most Americans unused to bell music the first reaction is to protest that bells are all right but that it is just a bit childish to expect much from the ringing of bells. Yet in Europe, in such countries as England, Belgium and Holland, carillons are fairly common, and it is not unusual for 60,000 persons to hear operas and concerts played by the great bell masters. There are such men as Professor Brees, who climbs 450 steps of the great tower of Antwerp Cathedral each day to play the bells to which thousands reverently listen, and Sir Edward Elgar, the noted musician, who has composed many famous carillon pieces.

There are an almost endless number of changes that can be rung on a peal. Such a carillon would hardly have been possible in early times when the casting of bells and the obtaining of definite tones were left more nearly to chance. Bell makers of today regulate the pitch by the thickness of the striking part in proportion to the diameter. Working by such mathematical rules, perfect instruments of music are now produced.

On such a national occasion as Lincoln's birthday it will be possible to have some master carillon player reproduce the favorite hymns of the great President. Not only will the residents of the capital be able to hear such music, but, by means of the radio, a whole nation will have the opportunity of listening.

As a national memorial the carillon will also be democratic, for each day at morning, noon and night it will, by means of an automatic arrangement, render selections from the world's masterpieces. It will thus contribute to that ideal wherein good music shall be popular and popular music good.

The cost of the National Peace Carillon is estimated at $3,000,000.

Beggars Collect Fortunes From the Public

Stories of Organized Mendicancy That Rival the Thousand and One Nights

Member of the Profession Who Owns a Car, a Farm and Five Bank Books

By COURTENAY SAVAGE

Hark, hark, the dogs do bark,
The beggars are coming to town,
Some in rags, some on nags,
And some in velvet gown.
—*Old rhyme.*

A DETECTIVE of the city's mendicancy squad walked along a crowded street one evening, and noticed a legless man who presented a most pathetic appearance, a man who, ill-clad against the rawness of the night, stretched forth eager hands that offered for sale gaudy-colored lead pencils.

It was really a clutch of sympathy that made the detective stop, for the man looked as if he might actually need food. In a couple of minutes, however, the detective's attitude had changed. He stood and watched with wide-eyed wonder as a stream of small change poured into the beggar's hands, and he noted that not once was a pencil taken in exchange for the coin.

And what a lot of coin it was! The detective edged still closer, where he could watch the operations of the man, and in the twenty-odd minutes that followed the man of the law made a rough count of more than nine dollars as the sum collected by the beggar. Then he arrested the man.

"What do you mean, you're going to arrest me?" the beggar shouted when he felt the touch of the law on his shoulder.

"Come on, you've picked up enough for one night," the detective told him.

"You let me alone. You can't frighten me. I can't be persecuted by you grafters," the beggar shouted, thinking to arouse the sympathy of the crowd that gathered.

But the crowd was not sympathetic. The night was too raw to stand around and champion the rights of a beggar. So when the detective said that he was going to call a policeman and have him ring for a patrol wagon, the beggar changed his tune.

"Don't send for the wagon. Come on with me. We'll ride."

The detective wondered. It seemed like a new trick. He was armed and interested, so he followed the legless man and his "skate," as they call the little wheel platform on which beggars ride. Down a block, and round the corner into a side street they went, and then the man stopped. A chauffeur jumped out of a handsome sedan car, and started to help the legless man to the back seat.

"What's this?" the detective was amazed.

"My car, come on. You tell the fellow where to drive."

Then, without any fuss, the beggar allowed himself to be driven to the police station where he calmly told the story of his existence. His name, so he said, was Frederick Hammill. He was born in the South, lost his legs in infancy, and had taken up begging as a profession. Once he had amassed more than $20,000 which he had begged through the South and Middle West, and this sum he had invested in a North Dakota ranch. A season or so of bad crops had wiped out his money, and he had gone back to begging. At present he owned a farm in Massachusetts, his sedan, which cost him $3,000, and he had deposits in five different banks. He traveled from town to town in his car, begging first along one main street and then the next. Also, he offered to leave the city at once if the magistrate would let him go.

And the magistrate did let him go, for, after all, he had been offering his pencils for sale, though, of course, he never urged anyone to take a portion of his stock.

Such is the remarkable story of one man's profession, a story that rivals in its way the tales of the thousand and one nights. A legless beggar, riding in a sedan car, and boasting of five bank books and a farm! No wonder there is a saying in the underworld that any man who works for his living is a fool! Not that beggary and crime are closely allied, but there is a bond between them, for statistics show that about ninety-eight per cent of the beggars are working under false pretenses, and extracting at least $100,000.000 a year from the American public. The police and charity authorities of such cities as New York, Boston, Chicago, Detroit, all the larger metropolises, figure that the inhabitants of each city pays out from $5,000,000 to $15,000,000 a year to those who ask for alms.

Quite a sum, isn't it?

The real, underlying reason for this tremendous expenditure is as interesting as the expenditure itself, and while there may be something startlingly wrong in the fact that the public gives away such a sum each year, the public does get something in return, and that is a feeling of self-elation. Every time a man drops a few pennies into the hat of a crippled or blind beggar he has not only softened his heart through his sympathy for an unfortunate, but he also feels a sense of having performed a duty. With women there is a small note of psychology in their giving—they think that it is lucky to give to the poor, but the truer motive comes through the quick stab of pity that fills them at the sight of what they consider suffering.

Beggars, of course, know all this. They know also the small tricks of the trade. The majority of beggars look as miserable as possible, even using theatrical make-up to appear pale and haggard. They are always careful not to show too much profit from their begging, the proper psychology being to leave two or three pennies in the hat or cup, quickly removing all the excess coins, for fifteen or twenty-five cents can buy a meal, and the public gives largely because of thoughts of hunger. Beggars also know that the most profitable form of begging is to offer something for sale. For this it is necessary to have a license in all the larger cities, and most of the smaller, but the license seldom costs more than a dollar, and is a form of police protection, for the detectives are not apt to bother a licensed beggar, and the magistrate will usually discharge him with a warning to find a real job, even though it is realized that the goods offered for sale are only a blind.

"I can't help it if they don't take my chewing gum and it gets stale," was the shouted defense of a woman beggar who had been literally hauled into court.

On duty at his usual post.

And the judge had to admit that she was right.

This particular woman was arrested in the Central Park district of New York City, where she had been begging for weeks. She was a deplorable looking creature, admitting fifty years, and looking older. The matron at the police station hardly dared to touch her clothing, it was so filthy, but as the woman was disrobed to be searched it was discovered that underneath her two skirts and two coats she wore decent, clean underclothing. In the pocket of one of these skirts was found more than forty dollars in bills. Another pocket held five dollars in dimes, and two dollars in smaller coins. A third pocket harbored ten dollars' worth of five and ten cent pieces, while a fourth had nearly four dollars' worth of pennies. About the woman's neck hung a bag containing bank books, which the police did not insist be examined. The woman admitted that she had begged all the silver in a couple of hours, depending on her deplorable appearance and a box containing three packages of stale chewing gum to gain her the money.

Twenty-one dollars for two hours' work! Not so bad, considering the fact that a good woman clerk seldom gets more than five or six dollars a day for a working period of from eight to ten hours a day! No wonder that the beggars, like the criminals, feel that the man who works for his living is a fool!

And the two incidents related are not unusual cases. Begging has become so profitable during the past five years, especially since the close of the war, that there has come a cry from the police of the towns throughout the country that the beggars are increasing, and growing more bold in their efforts to obtain wealth. Also that the vast majority of the beggars would be at work if it were not for the fact that they have discovered that the American public is quite willing to support them in a manner actually approaching luxury.

It is not very long ago that the National Committee on Vagrancy and Begging came into existence, yet within a year this committee has been able to pile up so much data that it is necessary to deal with mendicancy as a nation-wide menace.

The chief intention of this National Committee is to plan for the redemption and education of beggars by teaching them useful trades. It will also attempt to show the smaller cities and towns how to check the increasing army of beggars which has been estimated at 1,000,000 for the whole country. Blind and crippled beggars are placed in a class by themselves, but nearly all types of "panhandlers" can be taught a trade. Most beggars are frauds, and statistics show, time after time, that what is apparently a case of poverty, often of starvation, is only a pose, and that the beggar has money, often in large sums, about his ragged clothing.

"I'm starving, please give me ten cents for something to eat," cried an old man to passers-by. One of those who came to his aid was a detective who, after he had given the man a dime, watched to see what he would do. There was no dash for food, only a quick dive into a pocket where the money was dropped. Then the detective arrested the man and a search showed that he had $1,517 hidden in his clothes. An even wealthier beggar was revealed through the arrest in Albany, New York, of a man who said he was James Tolson, of Wilkes-Barre, Pennsylvania. When searched he was found to be carrying $15,000 in bills, Liberty bonds and Industrial bonds.

The boldness of the beggars is colossal. One night a man walked into the police station at White Plains, New York, and asked for shelter. The man was middle-aged and had a wooden leg. Feeling sorry for him, the desk sergeant gave him accommodations for the night. In the morning the sergeant noticed the man apparently fixing his wooden leg. He also thought he saw a wallet. He asked the beggar to show him the wallet, and he reluctantly agreed. The wallet contained ninety dollars. The sergeant questioned the man further and searched his clothing. In one pocket was found an old tin cup. This cup and the wooden leg was the man's stock in trade, and he had begged the money in a short time—changing it to bills because it was easier to carry. He also admitted that he always slept at police stations in towns where he begged. It was so much easier than having to look for a rooming house.

Such cases as these are common among the police throughout the country, but an unusual incident was when the wife of the magistrate of an eastern city uncovered a syndicate of beggars. This woman started to do her marketing early one day, and she noticed a very prosperous-looking man piloting a blind beggar to a busy street corner. She spoke to a policeman who arrested the well-dressed man, and took him to the station house for questioning. There the man gave his name and address, and admitted that he had started a begging trust. He hired cripples and blind men for three dollars a day, and took their earnings which often amounted to thirty or forty dollars a day. He had four persons working for him at that time, two women, and a blind boy, as well as the man he had been taking to his "post" when arrested.

The end of the war gave the clever beggar a new angle on how to get money from the public, for the returned soldier was known to be jobless, and often in very distressing circumstances. Therefore, a man in uniform who was begging for enough money to get a meal, or a place to sleep, found that coin rolled into his pockets in a silver stream. In the six or eight months following the end of the conflict there were so many beggars in uniform that city after city passed laws forbidding begging in uniform. One smart beggar who worked among the theater crowds of Broadway in New York admitted that he made at least sixty dollars in the hour before and after the theater. He was dressed in the uniform of a private, wore two medals supposed to have been won for service, and showed an arm cut off at the wrist. When he was arrested he gave his name as Thomas Campbell, said that he had never been in the army, and that he had lost his hand while acting as a strike-breaker in the Middle West.

In Chicago they started a crusade against beggars in uniform and in one day arrested a gang of five men who had purchased second-hand uniforms, and who rode from their lodging place to the downtown section of the city in taxicabs. Not one of these men had ever served in the army, but each made from forty to seventy dollars a day through the aid of the sympathy aroused by the uniform they wore.

Another Chicago round-up of beggars was directed toward a gang of small boys and girls, all of whom were hardly old enough to be brought into court. These youngsters had been taught by a man who escaped the police net to stand in front of the theaters and hotels and beg. The exposure came about in an unusual manner. A man saw a nine-year-old lad begging before a motion picture theater, thinly clad, eyes blackened, one sleeve empty. The man's heart gave a quick throb of sympathy but he could not stop to do any real good for the boy as he had to catch a train. So he went up to the first policeman, gave him a bill, and told him to see that the boy was given a good meal, and that with the change from the bill he was sent to his home in a cab. The policeman did as he was asked, but in the clear light of the restaurant it seemed that the boy's

(*Concluded on page 15*)

Safety Valves of the World

Concluded from page 6

strained in the heart of the globe fashioned for itself a vent greater than all of them, in which the subterranean fires throb eternally, and through which, in times of stress, the excess pressure which otherwise would hurl our world into the dust of a comet's tail, finds relief. Thus the Hawaiian Islands were formed, and there, in Halemaumau, "House of Everlasting Fire," the liquid rock bubbles forever over the flames that warm the heart of the world. This greatest of all earth's fumaroles is merely a fire pit in the center of Kilauea, a crater more than 3,000 acres in extent, composed of black-crusted lava, through the cracks in whose hardened crust, the fires of the middle of the earth glow constantly. This crater is surrounded by cliffs more than 500 feet in height, while the "House of Everlasting Fire" is itself a vent, a tube of stone more than 500 feet in diameter and at least sixty-five miles deep.

Kilauea, the great crater which holds this safety valve of the world, is 4,040 feet up on the side of Mauna Loa, a still mightier volcano, 13,675 feet in height, and active. On the same island are two other safety valves, Mauna Kea, 13,805 feet, and Hualalai, 8,273 feet. All these were built up from the bottom of the sea, creating their own cones as they rose. On the island of Maui, northwest of the island of Hawaii, stands the largest known volcanic crater, Haleakala, "House of the Sun," nearly 30 miles in circumference and 2,000 to 3,000 feet deep. It is not active, though by no means dead, merely sleeping, with enough weight on the safety valve to hold it closed until such time as the "House of Everlasting Fire" cannot alone handle the excess of the subterranean forces.

But if the "House of the Sun" is quiescent, the crater of Kilauea and its fire pit, Halemaumau, make up in perpetual "blowing off" what all the other volcanoes lack. Within this crater, the scientists believe they have found the valve that keeps below the danger point the slumbering forces beneath all the other volcanoes in the world, and particularly the scores of sleeping cones and craters which surround the Pacific Ocean. When subterranean pressure becomes too strong, and Vesuvius, Etna, Colima, Stromboli, and the others become restless, the great pit of Halemaumau becomes agitated, the lava pillar rises, fills the crater and, when the rim of the latter is reached, flows over and down and into the sea, eternally building up the island it created in ages before men came to this part of the world. And, when Halemaumau lets go, the other volcanoes subside. The explosions within this fire pit and within the surrounding crater of Kilauea are the most powerful in the world, far in excess in violence and power even of those in Vesuvius and Etna, for it is upon this vent that the globe depends for that relief which will save it from sudden dissolution into cosmic dust.

The "valve" in this safety valve of the world is, of course, a plug of lava, more or less solid, weighing hundreds of thousands, if not millions, of tons, and raised or lowered by temperature and pressure. In the central vent of Halemaumau, this plug is always molten, boiling, liquid lava over which play continuously eerie sheets of flaming gases. But surrounding this 500-foot safety valve, which has never been closed, and which is still "popping off," as engineers say, there is the greater valve of the whole 3,000-acre crater of Kilauea. The floor of this vent, three or four times as wide as Halemaumau, is a plug of semi-solid lava, with a cooler crust over the top. At present, neither heat nor pressure in the interior of the earth is sufficient to lift this valve—Halemaumau's valve is sufficient to relieve the world's subterranean troubles just now. But the time has been, in the not far distant past, when the whole 3,000-acre plug was melted and raised and poured over the summit of the surrounding cliffs—more than 500 feet above the present floor—to flow away into the sea, increasing the size of the island, and saving our globe for us. Whenever the internal heat and the pressure again exceed the resistance of the great column of lava, this valve will "pop" once more.

Mount Shasta the Beautiful

NOT all the volcanoes around the Pacific are idle; there are other and minor safety valves, many of which are contributing, in a small way, to the safety of the earth by blowing off steam, ashes, crushed rocks, sand, cinders and similar by-products of the tremendous forces ceaselessly at work beneath the crust of the globe. In the Aleutian Islands alone there are forty-eight craters, twenty-five of which are still active. In Southeastern Alaska, there is Mount Edgecombe; Mount Wrangel is still steaming on the Copper River; Mount Redoubt and Mount Iliamna, on Cook's Inlet, also are smoking. Farther south, there is Mount Baker, whose last eruption occurred in 1843; Mount Tacoma (Rainier), still with a halo of steam around its head; Mount St. Helen's, Mount Adams, Mount Hood, whose fumaroles still smoke, and Mount Jefferson, as well as the Three Sisters, all in the Cascades, and all likely, at any time, to renew their activities if anything should happen to plug up, even briefly, the vents on the Hawaiian Islands, or should the heat and the pressure in the interior of the earth become too great to find relief through the 500-foot safety valve on Mauna Loa's flank.

In California, is Mount Shasta, down whose sides vast volumes of flaming lava have rolled since the glacial epoch, and whose subsidiary crater, "Shastina," still steams and smokes. This is supposed to be the most beautiful volcanic cone in the world. Mount Lassen, still farther south, was in eruption late in 1923, and, before that, was active in 1915 and 1921. Flat craters, many of them filled with saline lakes, such as Mono, dot the western deserts of the United States, and there also are large groups of mud volcanoes, all doing their bit to relieve that tremendous interior pressure and heat. In Lower California, the Three Virgins were in eruption as recently as 1857—and seventy-five years is a mere trifle in volcanic history—while in Mexico, out of a dozen smoking or quiescent cones, Colima is in continuous activity.

A volcanic ridge whose peaks are crowned with numerous active craters runs through Guatemala, San Salvador, Honduras, Nicaragua and Costa Rica. In Guatemala alone there are two active, four quiescent and fifteen so-called "extinct" volcanoes; in San Salvador, five active, three quiescent, and three "dead"; in Honduras, two smoking and three quiescent; in Nicaragua, four active, eight temporarily quiet and five "extinct," while in Costa Rica, there is one active, with two quiet, and six "dead." The chain runs on down through South America, paralleling the coast and following closely the line of the submarine trench of 2,000 fathoms or more, which continues southward along that shore. Here are some of the highest and most magnificent volcanoes in the world, towering Aconcagua, 22,867 feet; lordly Chimborazo, 20,498 feet, and symmetrical Cotopaxi, 19,619 feet above sea level. The craters and cones of Erebus and Terror mark the site of volcanic activity on the Antarctic continent, while the volcanoes which make up 2,650 islands of the Pacific, as well as those which border the western shores of that ocean, are virtually numberless. Probably not all of them have been named or described, but they range from Bogoslof, a "young" volcano in the Aleutian chain, to ancient Asosan, a crater containing more than 100 square miles of floor area, on one of the Japanese islands.

It is probable that Asosan was once the safety valve of the world, just as Halemaumau now is, but that must have been long ago, possibly about halfway down that hundred million years which scientists estimate to be the age of this earth. Today, man is able to live on the slopes of all these myriad volcanoes; in fact, he owes his existence on any part of this rolling globe of silicon and water largely to the fact that out in the middle of the Pacific there is a safety valve, through which the pent-up forces of unmeasured heat and uncalculated compression may vent themselves with safety.

Resuscitation of Apparently Dead Cities

Concluded from page 9

lem in our cities today relates to their condition of health, the conservation of human life. The wealth and strength of a nation rest on its men and women. The city is but a subdivision of the state, and its biggest asset should be its condition of health. Foremost among the things which promote health in any community is good drainage. This does not mean that sewers must merely carry their contents beyond the confines of the neighborhood, there to be caught and held in some noxious backwater, while myriads of malignant germs mature and swarm forth as from some Pandora's box. Today we realize more than ever before that the world is one big neighborhood; that people living in the same city—be it ever so vast and mighty a city—are neighbors: Nay! More than neighbors, brothers! And the sewer which does not keep its contents moving till they are carried to where they can be a menace to *no one* fails in its function.

So, too, does the storm water sewer which receives the water from the streets and walks, from the house tops and the open places—fair water when it fell from the heavens, but now fouled with every disease germ which might linger in the air or settle in the dust—if it but carry this polluted water to some low place in the ground or to some stream so sluggish in its movement that it forms a cesspool covered with a foul scum of sickening pestilence.

Good drainage, the first and greatest requisite of the healthful city, is obtainable only by intelligent planning based on a full knowledge of the territory covered. And equal to good drainage in all things is the requirement for good water. Put either of these first, it matters not which, the other will be found alongside it. And close behind these two comes a third—*good streets*. These three—*drainage*, complete and adequate; *water*, pure and plentiful; and *streets*, well planned and well built, form the backbone of the city healthful; and have you never considered how the *city healthful* is parent to the *city beautiful?*

There are many offshoots from these three great requirements: parks and playgrounds, car lines, fire protection, stream improvement, public parking places, and many others. None of these can be economically obtained without a suitable foundation—the complete knowledge as far as is practicable of the ground on which the city is being built. Without this good drainage cannot be obtained, good streets be planned and built, or good water distributed.

We have briefly considered the city plan with reference to the public health. Let us now consider its relation to public economy—the conservation of money paid in for taxes. No one doubts that sickness costs money, that public health makes for economy, but there is another economy produced by the city plan which should appeal directly to every property owner. It is the economy of greatest efficiency at least cost, the economy of having the *one best plan*. In doing a given thing, though there be many ways of doing it, most of them good, there is one way which is better than the others, giving greatest results for effort expended.

In building a road through a given territory how does the engineer proceed? He endeavors to place the roadway close to the desired location, yet have no excessive grades and at the same time keep nearly equal the amount of dirt and rock which must be taken from the hillsides to make place for the roadway and the amount which must be dumped in the low places to elevate it. With a thorough knowledge of the ground, its hills and valleys, he can consider many possible routes and select the one which is best. When he plans a system of streets his problem becomes more complex, for not only must each street preserve in itself its economical qualities, but it must be in harmony with all intersecting streets. At the same time the blocks and lots must be well shaped and economically proportioned. An almost endless variety of plans is possible in such a case, and only careful study will determine which one is the best.

China's "Stooping Soldiers" and Their Ways

Concluded from page 4

in China is another matter. There is a consolidating movement of "China for the Chinese." But this is a bloodless uprising. China wishes to be let alone. She has been too much bossed by the Occidental. She has attained considerable confidence in her own capacities. The young Chinese yearn for control of things. They and the revolution have introduced a ferment into the social order. Old institutions are being destroyed, and new ones or none are being set up in their places. License holds forth in the name of liberty. And this is another, less direct cause of the social disorder of which the increased virulence of the old disease of banditry is a symptom.

A sort of Bolshevism, not the Russian kind, has seized upon China. It is the political and mental aftermath of revolution. Something commensurate with the thirteen years of chaos that followed the signing of the Declaration of Independence in America is taking place in the East. But the difficulties there are greater, the problems infinitely more complex. The United States had no incubus of old custom. Unlike China, it had a long tradition of democracy and was schooled in the theory and practice of self-government. Above all it was devoid of the spirit of militarism that is China's chief present obstacle to the establishment of stable government and social order.

At first glimpse of John Chinaman in uniform—this was before the Great War and shortly after China's revolution against the Manchus—we took delight, and some amusement, in his German goose step. But it was no laughing matter, after all. With his lax discipline, his tendency toward grinning inattention, and his somewhat laggard response to the cadence of *ee, erh, san, sze*—one, two, three, four—he was nevertheless a good soldier. He had won his spurs in the revolution of 1911, during which a few battles of really heroic character had been fought. And his status, though it remained imperfect, was a far cry removed from the time of the later Manchus, when no more than an undisciplined and archaically armed rabble met the trained legions of Japan.

To a considerable extent the Chinese army of those days existed largely on paper only. Inspectors about to visit a camp politely sent word beforehand, so that the commanding officer might have time to send out into the alleys and highways of his district and hire for the day enough idlers to fill his roster. After inspection was over these rear-rank supernumeraries would be relieved of their military jackets and muskets, and pay for the remainder of the year would go into the commanding officer's pocket.

The Chinese Government has a standing army of 1,335 835 men—in theory. Probably there are actually more than a million men under arms throughout the republic, but their allegiance is various, anything but national. President Tsao, who is reputed to have won his election through the aid of both monetary and military influence, has at his command his own troops, those of the province of Chihli, and in time of need might have under his standard the provincial forces of half a dozen *tuchuns*, depending entirely upon either their momentary favor or his own momentary strength of authority. But various provinces appear to be at all times in a state of potential if not actual rebellion against Pekin, and the entire south has been at war with the northern government for more than ten years.

Soldiers Turn Bandits

SOME of the more farseeing governors have found money for their pay rolls in legitimate directions, and some of the less rapacious have not only kept their men satisfied by almost, if not quite, paying them in full, but have given them training and rudimentary industrial education. Others, however, have been content too often to line only their own pockets with the fruits of taxation and extortion, leaving their men to shift for themselves.

The Chinese press, we noted, had long been complaining of this condition of affairs. But the press, which on the whole represents vigorously the views of Young China, seemed pathetically devoid of effective influence. "The Chinese newspapers of Pekin," was the comment of the *Far Eastern Review*, "have given prominence to the result of an investigation concerning the wealth of the super-*tuchuns*, ordinary *tuchuns*, simple governors and statesmen, and everyday grafters in high position, disclosing that seventy-one such embezzlers are worth more than a million dollars, the total of their wealth coming to the huge sums of $631,000,000."

The resolution of the Washington Conference, designed to give profound and fatherly advice to China—an infant among nations admonishing a hoary patriarch—called for a reduction of the forces under the quarreling *tuchuns*. This, to the Chinese, must have seemed a bit ludicrous. Various Pekin governments had attempted, without avail, to control the *tuchuns*. Proclamations, of which the Washington resolution was only an echo, had already been made. Demobilization had been tried, and had been found to be no more than a step in the vicious circle. Disbanded soldiers invariably became bandits, and the only cure for a bandit appeared to be reconverting him into a soldier. This was a common practice, of which there was no better example than adjustment of the Lincheng affair. A large part of the bandit rabble that held up the Pekin express train was eventually incorporated, just as the outlaws had demanded, into the regular army.

Hope of eliminating either militarism or banditry, it seemed to us, could hardly be entertained until there was some more lucrative alternative for either. The million men in China's armies, and the few odd thousands engaged in brigandage represented, approximately, the country's surplus of labor. Given jobs that would provide even a pittance, industrious China would have no problem of unemployment, peaceful China would have no inclination for the life of the "stooping soldier," and the *tuchun* business would go into an inevitable, unlamented decline.

Veteran Fights His Battles Over Again

William Harman, Aged Ninety-one, Whose Career Has Been Full of Thrills

By STEPHEN POOLE

TO BE the only veteran of the Mexican War in the United States Soldiers' Home, Washington, D. C., is the distinction belonging to William Harman, a fine old gentleman of ninety-one years of age. A man does not live fourscore and ten years, and then some, without having had many rich experiences. Harman has had his, and what is more, he still possesses a vigorous intellect and the ability to relate those experiences.

He was born in the town of Tarbert, County Kerry, Ireland, on January 2, 1831, and came to America when he was about twelve years of age. His father's people were of German extraction while those of his mother were English. This, coupled with his touch of Irish, made him a good candidate for American citizenship.

On October 20, 1847, Harman enlisted for the Mexican War. He was assigned to the Eleventh Infantry and was sent to Governors Island. There he was soon promoted to corporal. Upon being promoted to corporal he called at the commanding officer's quarters and advised the colonel that he did not wish to be a corporal. The colonel, very much surprised, wished to know his objections. He told him that if he was made a corporal it would mean that he would have to stay at Governors Island and help drill recruits, and that he wanted to go to Mexico. The colonel said, "Well, if you feel that way about it I will send you along next week with a bunch of recruits that are going in the Seventh Infantry." So Harman went to Mexico and did his "bit" in helping General Scott to victory.

A Civil War Adventure

WHEN the Civil War came it found Harman a lieutenant on the side of the Union. He tells a very interesting incident that happened during the fighting in Tennessee. Due to the capture of a small force of Confederates by a few Union soldiers under the leadership of Harman, the general appointed him to command a company of sixty scouts, with headquarters at La Grange. These scouts were picked men and furnished with the best of equipment. They proved very effective in the elimination of guerrilla warfare.

One day, when Harman had his company out south of La Grange, he saw a cloud of smoke in the direction of the little village of Ripley. He immediately headed his men toward the town. When they reached the main street they saw that a whole business block was on fire. The courthouse was just across the street from the burning block, and had an iron fence around it. Harman commanded his men to tie their horses to the fence and form a line. He called for buckets, and put part of his men to work at the courthouse well, passing the buckets along the line to the fire. They soon had the fire under control, when some one shouted, "The rebels are coming."

Immediately the soldiers gave up fire-fighting. Harman saw that they could not escape on their horses, so he ordered his company into the courthouse and locked the doors. He posted his men at the windows. Very soon a Confederate officer approached with a flag of truce. Harman hailed him and asked what he wanted. The demand came to surrender. Harman refused and told the officer that his men were ready to defend themselves. The officer withdrew and Harman noticed the women of the village draw around him, expostulating and apparently making some very emphatic demands. Very soon the officer again approached with his flag of truce. This time he advised Harman that the women would not let them fight, that they declared the Union scouts had saved the town from destruction, and that he would withdraw his forces from the town for three hours and give the scouts ample time to retreat.

About five years ago Harman wrote to an official in Ripley, and inquired if there were any people living in the town who remembered the incident described. He received a reply to the effect that there were several and that Ripley would be highly pleased to have William Harman return and pay them a visit.

Some years after Harman came to America and was at school in Philadelphia, several of his schoolmates decided to make a trip to New York for the purpose of seeing Barnum's museum. William went along. There was the mermaid, and the big gorilla. William was especially impressed by these two. He felt that the mermaid was a fraud. He did not believe there could be such a creature. As for the gorilla, he was a terrible looking monster and all the visitors kept out of arm's reach of the cage.

His Old Friend, the Gorilla

HOWEVER, William was to know more about this particular animal. Greatly interested in the exhibit he was straggling along behind the crowd, and was the last to start down the steps when he heard his name called, "William!" He turned and looked, but could see no one there, so decided that it must have been a trick of the imagination. He again started to leave when clear and strong came the call, "William Harman!" He about-faced with a start, and there was a strange sensation about the roots of his hair when he beheld a friendly paw protruding from the cage of the gorilla, and that monster began to speak in perfectly human tones, "William, don't you know me?"

William could not remember having met any person of this description, and if he had stalked through the wilds of Africa it must have been in his sleep. But the plaintive voice induced him to go nearer. Behold, it was one of his former schoolfellows in Ireland.

After Harman left the service he opened up a little store in Kansas. He did very well for a while, but eventually he experienced trouble in obtaining merchandise. One day a man came along with a team of mules and a wagon and offered to trade with Harman. The deal finally resulted in Harman becoming the possessor of the mules and wagon, with enough merchandise to stock the wagon. With this he set out to trade with the Potawatomie Indians. The venture did not prove satisfactory, and he finally gave it up in disgust.

There was one valley, however, into which he had not gone owing to the dangerous crossing of a river. He finally decided to venture across. He had not gone very far before he came in view of a hut and sitting on a rail fence nearby was a light-haired man with blue eyes. Harman inquired of him what he was doing there, and the man said he was an Indian.

"Well," said Harman, "you have not always been an Indian. Where did you come from before you became an Indian?"

"I was born in Ireland," said the sandy-haired one, with a decided Irish brogue.

"In Ireland?" ejaculated William, "and what part of Ireland, may I ask?"

"In County Kerry," was the response.

"County Kerry, and what town?"

"Tarbert," was the answer!

It was his old schoolfellow.

Here he was out in the wilderness of Kansas, with a full-blooded Indian squaw for a wife, and a bunch of straight-haired, blue-eyed children flocking at his heels. This was the last that Harman ever saw of his boyhood friend.

Harman describes as the hardest experience of his life a night spent in the woods of Tennessee during the Civil War. His regiment was under light marching orders, and they had to ford the Tennessee River. They had no blankets, no tents, and had to sleep on the cold ground in their wet clothes the whole of the bitter winter night. They were forbidden to build a fire for fear of attracting the attention of the enemy. This night had an important effect on Harman's future as it resulted in a severe attack of rheumatism which afflicted him, more or less, for the remainder of his life. It was finally the cause of the loss of his eyesight.

Success as a Song-Writer

SINCE coming to the Soldiers' Home, having experienced the trials of blindness, he has interested himself in the poor blind people of Washington. Harman is not entirely without means himself, and his ingenuity is also a valuable asset in devising ways and means. One of his injunctions to the writer was: "If you are going to write anything about me please do not forget to say some good word for the poor blind people of Washington."

He now has a new plan for giving them aid. He is a bit of a musician and author. He wrote a splendid World War song, "The Starry Banner." It was set to music by C. Harold Lowden. The words bristle with the patriotism of the old warrior. He has also written a beautiful tribute entitled, "Mother, Dear." The writer was accorded the privilege of hearing both rendered by the little graphophone in the veterans' room.

Harman has arranged an attractive little pamphlet which gives something of the history of the Soldiers' Home, and includes his song and some of his poems.

(C) Harris & Ewing

WILLIAM HARMAN,

Mexican War veteran at United States Soldiers' Home, Washington, D. C.

Notwithstanding his blindness, Harman does not have to depend upon his friends to keep up his correspondence for him. He is the possessor of a small typewriter, a curious-looking machine, upon which he pounds out his words. It is not the neatest writing in the world, neither are the words always correctly spelled, but it is far better than the effort of many a novice with two perfectly good eyes.

Harman is a splendid old man of character and refinement, whose ninety-odd years do not prevent him from feeling that he still has a work to perform.

Beggars Collect Fortunes From Public

Concluded from page 13

eyes were too bright for one who was blind. His suspicions were aroused, and he felt for the stump of the missing arm. Instead he found a perfectly good arm and hand strapped to the boy's body.

At the station house the boy told that his name was Harry Goodman, and that he was one of a gang. His parents were sent for, and given their first knowledge of their son playing the part of a beggar. When the whole gang was rounded up the lads told that they begged because the man gave them money for candy, movies, and such things. Also Harry said that he could get seven or eight dollars in a few minutes any night he cared to work.

One of the remarkable facts disclosed in regard to the beggars is the fact that while the majority of them appear ill-clad, there are several who wear neat clothes, and appear prosperous. These are generally beggars who disguise their trade as vendors, selling pencils, and so on. Another startling fact brought out by a careful examination of the men caught is that those who do wear ragged outside clothing invariably have good warm underwear, and the added protection of a chamois vest. Other interesting data is that there are comparatively few women beggars, and that in a great many instances the men who are begging are capable of holding really worth-while positions in other walks of life. One "panhandler" caught in a recent round-up admitted that he had been an expert stenographer, and a translator of foreign languages. He served at the Disarmament Conference, having been appointed to the post by Secretary of State Hughes. His excuse for turning beggar was that he could earn just as much money that way, and it was less work.

While begging seems a shiftless, unorganized sort of a profession, the men who really make it profitable show a certain shrewdness that makes it evident that they might easily become capable business men. They study what to wear, and where to stand. They take care of themselves so that the exposure to bad weather does them no bodily harm. They map out routes which take them from city to city. County or state fairs, city celebrations, political meetings of importance, beaches during the summer, the shops at Christmas and Easter time, and the churches on Sundays—they all spell money to the beggar. He may be "working" a small city during the week, and leave on Saturday for a nearby town, knowing that Saturday night in a small town is even more remunerative than a city street. Routes are laid out with the same care that a traveling salesman uses, and the money is generally deposited in the postal savings banks because it can be deposited in any post office. Sometimes the beggar travels with his family, generally not, but time after time the slick beggar carries a dog with him, knowing the tremendous appeal that a dog can have.

And so the beggars come to town, to your town and mine, and they grow comfortably rich to the tune of from $10,000 to $15,000 a year, often more. It may never be possible to stop beggars from plying their profession, but what the National Committee hopes to accomplish is to awaken the public to the fact that they are giving away $100,000,000 a year to men who are mentally and physically quite able to be self-supporting.

Hark, hark, the dogs do bark,
The beggars are coming to town,
Some in rags, some on nags,
And some in velvet gown.

That is the way the old verse told it—but a modern version would mention their automobiles, and the fur coats they wore when not at work.

And are you going to buy the gasoline for their cars? Think before you drop the next handful of change into a beggar's hat. And if you have any doubts as to whether a man is really hungry offer to take him and feed him. His actions and attitude will tell you the truth.

Also, if people would take the pencils, chewing gum, and so on, that they pay for, the majority of the beggars would soon be looking around for more profitable labors.

BRIEFLY TOLD

A stingless bee has been discovered in Panama by a member of the American Museum of Natural History, according to reports. It is as harmless as a butterfly.

In China there are streets given over exclusively to silk and fur shops. Other streets specialize in lanterns, fans or pictures. There are lacquer streets, silver streets, pewter streets and basket streets.

Switzerland is the first country to establish government insurance for school children. It was introduced in 1922 in the Canton of Basil which insured all the pupils in the public schools against accident and sickness. While it is not compulsory throughout the country other cantons and municipalities have taken steps in the same direction.

Japan is the victim of a new epidemic, resembling spinal meningitis, which is said to have caused 900 deaths in her western provinces. The death rate is placed at sixty-five per cent.

Two airplanes dusting calcium arsenate over 5,000 acres of cotton in the southern part of Texas completely eradicated the boll weevil from that area.

The United States is using her war-time explosives for building roads and clearing lands. When the war closed she owned 100,000 000 pounds of T.N.T. and "pyrotol" explosive, which she has been giving free to the states building highways and the settlers who need it to clear their land.

The slang expression, "I'll tell the world," which is so commonly used today, is not new but had its origin in one of Shakespeare's plays. It was first uttered by Isabella in "Measure for Measure." She says, "With outstretch'd throat, I'll tell the world aloud, What kind of man thou art."

The officials of Venice have ordered that in the future all the gondolas of that city must be driven by a gasoline motor instead of having a man stand in the stern and use a single oar. This will no doubt increase the efficiency of the city but it will destroy the gondola which for centuries has been the town's claim to uniqueness and charm.

The United States consumes three out of every five tons of the world's output of tin.

The British Air Ministry will soon establish passenger, mail and freight service with India by air with a fleet of Zeppelins similar to the American "Shenandoah." The schedule for the trip will cut the time for the journey two-thirds, as the fastest ship from Bombay through the Suez Canal takes fourteen or fifteen days.

Annual expenditures for billboard advertising in this country have increased from $5,000,000 to $60,000,000 in the past ten years.

A Buddhist temple of Boro-Budur in Java is being restored and preserved by the Dutch Government. The temple is supposed to have been erected in that country during the eighth or ninth century when the Buddhist kings were in power. Mohammedan rule was established there during the tenth century and since that time the temple has been in a process of decay.

Paper requirements have nearly quadrupled since 1889.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Statistics show that the world's consumption of timber is doubling every fifty years. Even in countries where wood is scarce it is increasing because the people are learning new uses for wood and becoming acquainted with those known in other countries.

In twenty-five years, according to estimates, the population of the United States will be 150,000,000.

According to a report issued by the United States Department of Agriculture, 42,919,000 acres of land will be sown to winter wheat this autumn. This will be an increase of 2,800,000 acres over last year.

Although the Armistice was signed only six years ago there are fifty World War veterans in Congress, including five in the Senate. There are also twenty veterans of other wars in Congress.

"God's Acre," a plot of land which received its name because its products will be sold and the proceeds used for the advancement of religion, is without a boll weevil on it. The same is true of the remainder of the ten-acre plot which was planted by Robert Blackwell, of Albany, Georgia, who decided that he would reserve one acre for God.

The making of paper with wood pulp first appeared on the census report of 1869. It revolutionized the paper industry of this country and since that time our output has increased eighteen times.

Sandstone soaked in melted sulphur, and then allowed to cool, has its crushing strength increased from 200 to 300 per cent making it in this respect equal to granite.

Premier Herriot proposes to abolish the Devil's Isle Prison, the notorious penal colony of French Guiana and known as a "man-made hell."

Australia is slightly larger than the United States in size and has a population of five and one-half million.

The liner *Berengaria* on a recent transatlantic voyage ran into a school of whales in midocean, cutting one squarely in two with her huge stem.

Rats, parked in a fire hose of the Schaumberg, Illinois, fire department, checked the water to such an extent that a fire destroyed $40,000 worth of property.

The Virgin Islands take their name from St. Ursula and her virgins.

Four new islands were born last year. Two appeared off the coast of Cochin, China; one off the Japanese coast, and the fourth, 1,000 feet long and thirty feet high, in the Bay of Bengal.

The Imperial Aviation Society has announced plans for flights by Japanese aviators across the Pacific Ocean, and also from Japan to London, for next year.

Forty per cent of the Swedish farms now run their household, dairy and agricultural machinery by electricity and 50 per cent of the houses in the country districts are lighted by electricity.

A steamboat captain on the Mississippi years ago curtained off his passengers' sleeping quarters in much the same manner as now prevails in Pullman cars. Each curtained room was named for a state. The rooms became known as staterooms and the name spread all over the world.

Paul G. Redington, United States district forester in San Francisco, has declared that there would have been practically no fire hazard in the California national forests, even during this summer's drought, if human carelessness had been eliminated. He stated that 657 out of 839 fires in California this year were caused by negligence.

Citizens of Pasadena, California, have subscribed to a fund for the building and equipment of a community playhouse to be opened soon.

An inscription placed below the picture of a rooster in a tavern room recently excavated at Pompeii, Italy, reads as follows: "When this rooster crows we'll give credit."

In France the export duty of 10 per cent on edible snails has been removed by Presidential Decree.

Gold is being mined in a marshy field at Caio, Wales, on a site said to have been worked nearly seventeen hundred years ago by the Romans.

"Radio is without question the most valuable item of equipment ever taken into the north by an Arctic explorer. It has enabled us to correct our chronometers daily within one-tenth of a second. Without correct time new lands cannot be placed accurately upon the map."—*Captain Donald B. MacMillan.*

"Just as we now give a harmless anesthetic to an individual for a surgical operation, so we may be able in the future to put a whole nation to sleep for 48 hours by a combination of new chemical discoveries with radio-controlled, manless airplanes."—*Major General Squier,* signal corps expert, United States Army.

Though the Zeppelin Company has built the ZR-3 for the United States, the German Government is footing the bills. Plans exist for a super-rigid which will fly around the earth in the latitude of New York City in seventeen days, carrying one hundred passengers, baggage, and fuel, without stopping.

As a means of relieving the shortage of pastors in Norway admission of women to the clergy is being advocated by many.

CHRONICLER OF THE NEGLECTED TRUTH

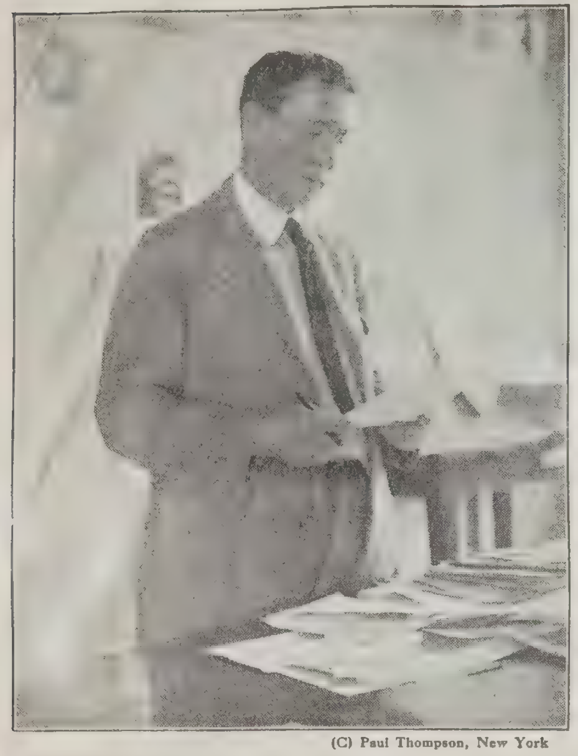
Well, What's All This About the Newspapers?

Modern Sheet Adopts New Code of Ethics

Charles Dickens Is Now Out of Date

By THOMAS L. MASSON

Thomas L. Masson is one of America's leading critics and editors. He is a writer for the *Saturday Evening Post* and conducts the *Red Letter Book Guide* for the *World's Work*. In addition, he is a reviewer of wide note, his reviews appearing in the New York *Times, International Book Review*, and other magazines. For many years he was editor of *Life*. His book, "That Silver Lining," issued last year, has commanded a large number of readers in this country.



(C) Paul Thompson, New York

THOMAS L. MASSON

SO MANY experts and insiders have lately been writing about the newspapers that one is inclined to paraphrase Mark Twain's well-known observation on the weather, when he remarked that everybody was talking about the weather, but nobody was doing anything about it.

In this article I intend to give some honest-to-goodness facts about the newspapers, or what is termed in guidebooks "dull but useful information."

A Self-Conscious People

WHAT is the reason so many have been writing so lately about our newspapers? It is due to what newspapermen call the "underground." The machinery of public expression is so finely organized in these days that where there is a widespread curiosity even felt on any subject, this demand is almost immediately followed by a flood of published material. For a long period, foreign critics have almost all been contemptuous, if, indeed, not violent, in their denunciation of our newspapers. Among these might be cited Dickens, Stevenson, Kipling, and many others more recent. Matthew Arnold said of them long ago: "The characteristics of the American journalist consist in an open and coarse appeal to the passions of the populace." Since this observation was made, in some respects, the standard of our journalism has been undoubtedly raised to a much higher plane. Vitriolic personal attacks are no longer indulged in. There is a widespread feeling of friendliness and co-operation among newspaper editors. Responsibility, accuracy, impartiality, fair play and decency are stressed in the "Code of Newspaper Ethics," adopted in 1923 by the American Society of Newspapers. That these desirable ideals are not always attained, and that there has continued to develop, along with them, the things which Matthew Arnold indicated, is, of course, the thing which makes us most concerned. The underground discloses it. Indeed, the underground is what may almost be termed a psychic means of communication. If I make a chance remark to an "inside" newspaperman today in New York, next Monday it will be repeated to me in Chicago. What people are asking for everywhere is felt by writers in tune with the underground. Similarly, people all over this country are harboring the same kind of thought at the same time. During the height of the bobbed-hair excitement (apparently still on) I received, within a few weeks, and from practically every state in the Union, burlesques on Hamlet's soliloquy, each one beginning with, "To bob or not to bob." The real reason why we Americans are so concerned about our newspapers is because the chronic nervous habit of reading them has made us the most self-conscious people in the world. We see ourselves in our newspapers, and the constant contemplation of all our exaggerated traits, as revealed to us in all the lights and shades of the typographical mirror we are looking into, gives us a guilty, uncomfortable feeling. We *are* our newspapers. I do not intend to bore my readers with technical terms, but it does happen that the psychologists have succeeded in uncovering a human frailty which is practically universal, and to which they have given a definite name: the "reverie," or, as some term it, the "daydream." Now this reverie, thus specified, is nothing but the habit of making heroes and heroines out of ourselves. It differs absolutely from creative work, which is very hard work, indeed, and involves intense concentration along definite and constructive lines. For instance, one of our leading authors, whose novels are almost the high-water mark in literary execution, passed three months, day and night, in thinking out in detail his last work. This involved the most rigid self-discipline, the inventive faculties working overtime, much as a factory will work overtime. At the end of this period my friend began his writing and finished his book in twenty-eight days, with practically no changes. That is what may be termed the scientific cultivation of the imagination. It is common to all great minds, scientists, poets and dramatists alike.

But the reverie is a species of mental *drifting*, in which the unhappy victim allows himself to think he is a great conqueror. All of us, if we stop to think, know what this is, and if we are fairly normal and sane, indulge in it very sparingly, much as one eats chocolate caramels. We are aware, by sad experience, of the fact that it gets us nowhere at all, and that when the dream is over, we land on ourselves with a dull, sickening thud. That is to say, we wake up with a jolt to discover that things are not at all what we hoped, and that we have a real job on hand, full of trials and experiments before we make good. That is when we feel secretly guilty.

Now this human and universal reverie trait is a thing which a great many people have learned can be catered to for good money. It is a gold mine which yields the largest returns known in history. Thus we have all those things in motion pictures, in fiction, in the drama, and particularly in the newspapers which, with brutal frankness, are designed and advertised to "take people out of themselves" and which constitute the most dangerous tendency of the times—along with another, which I shall mention later.

But on the other hand, it must never be forgotten that, because of this tendency I have briefly sketched, we are by no means a lost people. As Bryce said of us—to paraphrase his remarks—just as everybody despairs of the United States, and the referee is counting ten over us, we suddenly rise up in our majesty, and reveal the fact that we are the white hope of the world.

The real truth about the newspapers has not yet been disclosed by any of those able men writing about them; first, because very few writers are capable of looking at both sides; second, because most of them derive their support, either directly or indirectly, from the papers, and third, because the subject is too complicated to throttle down into a definite picture.

At least one indictment, in what follows, can be drawn against the newspapers, and, at this time, when we are trying to discover some way of conserving our material power, this indictment concerns itself exclusively with wastage. The newspapers, in visible form, falling upon us as the leaves in the forest fell upon the babes in the wood (whose unfortunate fate it is well for us to remember) furnish us with a constant example in waste such as the world has never before seen. Viewed in this manner, what irony it is for any editor to decry the extravagances of an extravagant government, or to deplore the lamentable attrition of our natural resources, when he himself stands, the symbolic head and front of all our offending? It is not fair to fasten the blame upon him. The facts speak for themselves.

All the News Fit to Print

A SINGLE, daily (not Sunday) average issue of our most representative—at least our cleanest and most high-minded—newspaper, namely, the New York *Times*, contains forty-four pages. There are eight columns to the page, making in all 352 columns. Of these, approximately 231 columns are devoted to advertising, and the rest to reading matter. This reading matter is as follows:

	Words
48 columns to general news, roughly	48,000
24 columns to sport	24.000
2 columns to society	2,000
4 birth and death notices	4,000
1 column to drama	1,200
8 columns to editorial (including letters, and so on)	9,600
3 columns to real estate	3,600
31 columns to finance (including tables)	31,000
Total	123,400

A solid column of type will run about 1.200 words (as on the editorial page) but will average about 1,000 words throughout, allowing for heads and subheads. A comparison of the *Times* with other papers of similar patronage, for instance, the Chicago *News* of the same week, shows about the same total result. The *News* runs forty-four pages, has forty-four columns of general news, only two columns of editorials, and many popular features such as the *Times* does not run—serial stories, syndicate material, and so on.

In the main, and omitting all pictures, we may say that your daily morning paper, published in any one of six of the largest American cities, contains from 125,000 to 150,000 words of solid reading matter, grouped under various heads and departments, according to locality and the nature of the public clientele.

It will be found that the general news of the day, foreign, domestic, speeches, all important material that is classed as news for that day, will run on the average from 40,000 to 50,000 words. This is what we are assumed to consider it our duty to read, but which nobody ever does.

How fast can you read? A test shows that the fastest record made in public, where the reader was reading material unfamiliar, and was obliged to tell what he had read, is about 450 words a minute. This is very exceptional, very fast, and so far as I have been able to discover, has been made only once. The rate goes down to 100 words a minute. Tests show that the eye of the reader does not take in individual words, but leaps from group to group, in a series of mental pictures, much as films are taken. Phillips Brooks, the famous Boston preacher, was one of the fastest speakers in the world. I once heard him deliver a sermon and was told afterward the rate was very close to 200 words a minute. I have heard Woodrow Wilson a great many times, and as nearly as the test could be made, he spoke about 120 words a minute, the rate naturally varying with his thought. My own test at reading shows that the rate varies with the material. I read Hamlet through easily in one hour and forty-five minutes. Hamlet is about 30,000 words and my rate was therefore 300 words a minute. But I had read it often before. I have read a 60,000-word novel easily in three hours. My own rate, which is admittedly very fast, runs from 200 words to 300 words a minute. If you will test yourself, however, I think you will find that in reading a newspaper rather closely and intelligently, the rate will run about 200 words a minute. Therefore, to read 40.000 words of general news every morning would take 200 minutes, or more than three hours. To read a newspaper through, word for word, any weekday, at the rate mentioned (120,000 words at 200 words a minute) would take ten hours.

When we come to the Sunday papers, we have immediately an enormous expansion. The Book Review section of the *Times* contains from fifty to sixty solid columns of type, averaging 1,200 words to the column, not including pictures. Here are at least 60,000 words, written by the best writers in America, every Sunday, which would require 300 minutes, or five hours of reading alone. The magazine section contains at least 40,000 words, which would require another three or four hours. A single Sunday issue of a large, important paper like the *Times*, which has probably come nearer to printing "all the news that's fit to print" than any other, contains more than 500,000 words of solid reading matter. If you started to read it through, word for word, it would take five days reading steadily eight hours a day.

What is the answer?

The answer is that nobody does.

Anybody can make the test. What actual part of your daily paper do you conscientiously read every day?

President Coolidge has acquired the reputation of being a very terse man. His speeches are not noted for length. Ask half a dozen, or a dozen people you know, how many of Mr. Coolidge's speeches they can conscientiously say they have read through.

In reply to this, it may be stated that this is no argument against printing all of the so-called news, and that if the papers went to the other extreme and printed only summaries, we would be worse off. My reply lies in an experience.

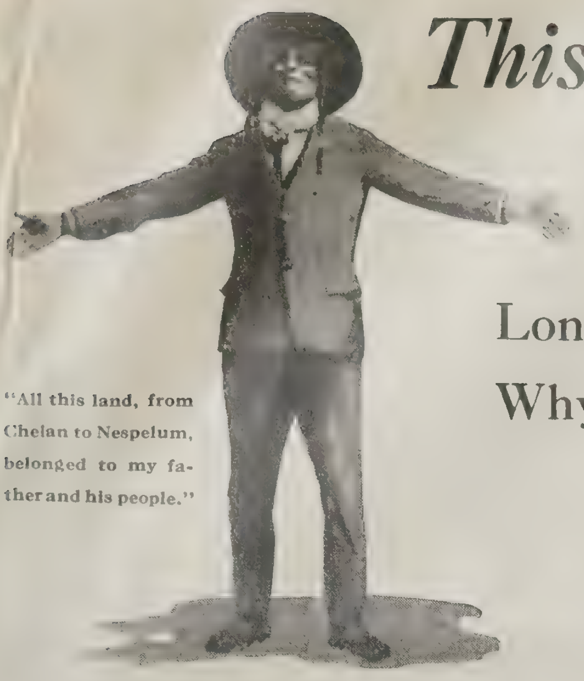
Disentangling the Dawes Plan

BEFORE the Dawes Committee made its report (this report was about 20,000 words. Did you read it or any part of it?) I was asked to take part in a debate, the question being whether Germany should be made to pay or not. To prime myself on my subject, I spent two weeks in securing, from all the newspapers I could reach, news reports from Berlin and London, covering the ground. Besides this, I collected all of the magazine articles I could lay my hands upon. But I found that the actual cables from Germany and England were the most essential part of the affair, as they contained a vast amount of material gathered constantly on the spot by a horde of correspondents.

In this way, I collected in one week more than two million words from newspapers. I then started in to read, and read continuously for more than a week, making notes as I went along.

When the evening arrived for the debate, I saw by the bundles of clippings displayed that my fellow debaters had not been idle. The first man got up and presented a long line of figures. The next man had a similar line but they varied from the other's. I had tried to get some sort of connected argument, but at the apex of my speech, I got tangled up, and pausing suddenly, indeed, almost bursting into tears, I exclaimed, "Gentle-

(Concluded on page 14)



"All this land, from Chelan to Nespelum, belonged to my father and his people."

This Is My Own, My Native Land! Say the Sons of the Forest

Long Jim, the Siwash, Speaks of Vanished Glories; Why Indians Cling to the Wide Rolling Wilderness

By F. J. CLIFFORD

"Breathes there the man with soul so dead
Who never to himself hath said,
This is my own, my native land!"

WHAT a strong appeal the above words of the great poet, Sir Walter Scott, have for the heart of the individual, no matter what land he may call his own. To me, the expression received a fullness of meaning that I had not dreamed of before, through the investigation of the following item which appeared in the Wenatchee *Daily World* as follows:

Washington, May 27.—In protest against the breaking up of their allotted lands by the white man, sixteen Indians on the Colville Reservation in Washington state have refused to accept checks forwarded them by the Federal Government as per capita payments in the allotment of their tribal funds. The individual amounts ranged from $30 to $180 each and totaled $1,260.

The checks were referred to President Coolidge who returned them to the Indian bureau with a petition by the sixteen Indians asking that their reservation be held intact.

Indian Commissioner Burke announced that the returned checks would be canceled and the money deposited to the credit of the assignees for payment on demand.

The average person in reading this article would naturally think it quite foolish of the Indians to refuse the money. I thought so myself, although I had known for some time that certain of the reservation Indians had refused the checks.

Just what good it would do them to refuse the proffered money I did not know. A storekeeper at Monse, Washington, a small frontier town on the Okanogan River where the Indians trade, told me that Long Jim, one of the sixteen Indians, was the most bitterly opposed to the payments.

Now I have known Long Jim for a long time, nearly twenty years. We have had many wa-was (talks) together, he speaking Chinook and a little English, and I speaking English and a little Chinook; and with that and much waving of hands, backing up and coming again with an added word or two, we have managed to exchange views on a variety of subjects.

So to get at the reason of it all I made a trip up the Columbia River to see Long Jim, who lives near where the Okanogan empties its warm waters into the larger stream.

Beaching my skiff on the first good landing place, I climbed the forty-foot bank, stopped a moment to speculate at the deep pits where the Indians had their winter abodes in the long ago, then a short distance farther to the home of Long Jim, the Siwash; a home consisting of the usual pole corrals, a shacky barn or two, a very good frame house and the inevitable wikiup (tepee).

The old smoke-stained wikiup is mostly sentiment, for Long Jim and his family use it but little. I believe that they, in a secret way, love to keep it in sight as a symbol of the long ago—a kind of tie that the presence of the white man cannot dispel, for the Indian has far more genuine sentiment than the average white, though, like the Scotsman, he'd rather die than show it.

His mind is wonderfully imaginative. He has clothed each mountain, hill, river, landmark of any prominence at all, with a fanciful name back of which is always a story. The funny, highly entertaining Negro stories of the South are nothing more nor less than old Indian legends told by them to the Negroes in the early slave days.

Long Jim was away when I arrived at his house. His daughter, a girl of some seventeen summers, told me he was out looking up the cows. While talking with the girl and her mother who had just come in from the corrals, Long Jim came into view. Seated on his favorite white horse, a wide black sombrero atop his braided graying hair, and riding very straight and easy, he presented a picture, typically Indian.

"Klahowya Jim" (hello), I greeted when he rode up. "Kanta mika tum-tum kopa alta." (How you feel today).

"Oh—mebbe skookum (good)," he answered.

After putting the horse away, he returned to the house. In the meantime, I was cudgeling my brain for some line of conversation that would lead to the subject I had come to discuss. Through long years of mistreatment and deception at the hands of the white man, the Indian has become exceedingly suspicious. Should I broach my subject too suddenly or give Long Jim any reason to think I had any ulterior motives, he would close up like a clam, and no matter what I might say or do, my Indian friend would "halo cumtux" (not understand) a thing.

As we seated ourselves in the shade of the porch, the sight of the slow-flowing Okanogan gave me an inspiration.

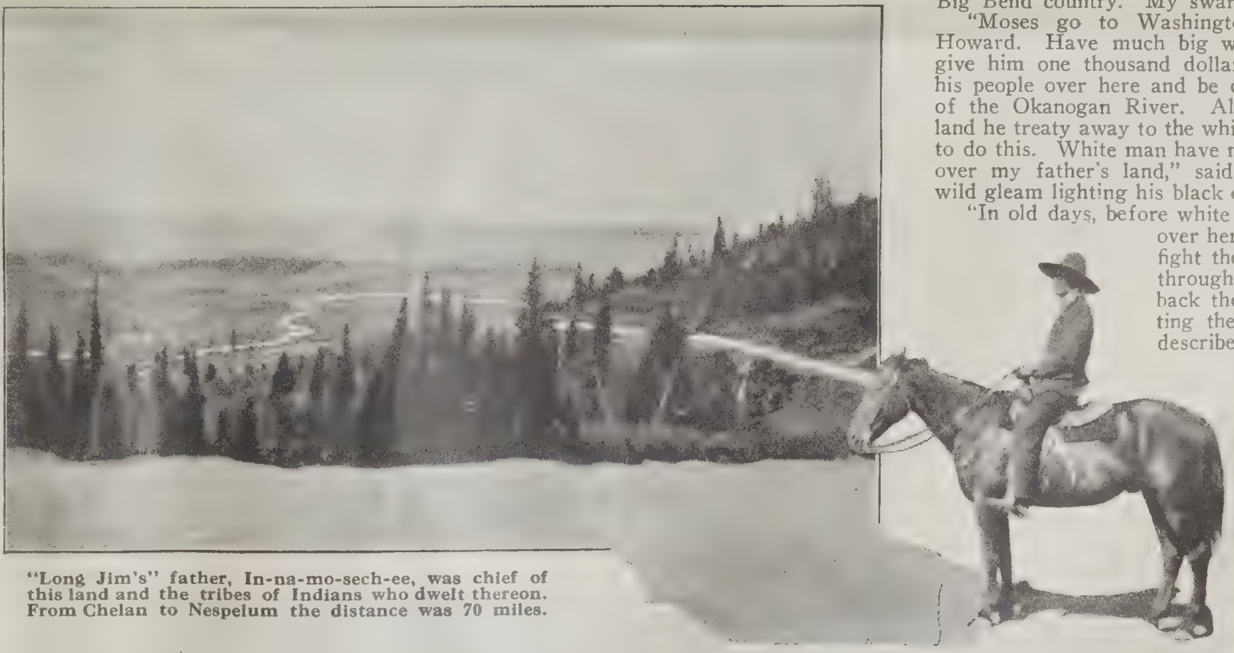
"Long Jim," I said, "has salmon come now, salmon come up Okanogan?"

"Halo salmon now," he answered. "Salmon come maybe, July. Come little salmon—come hi-u big salmon, this long," indicating the length of his arm.

"Salmon swim around mouth of Okanogan," he continued, "maybe one day. maybe two day to rest before start up river. Jump all around like this." Pointing his hand upward he indicated the jumping of the salmon by long curves up and down. The Indian is an adept at pantomime. A few gestures of hands and body, accompanied by three or four words and the red man conveys a picture, most wonderfully clear.

"Lots salmon, come July?" I asked.

"Halo lots now," he answered. "Ahnkuttie (long ago), lots salmon. Ahnkuttie, salmon come up river—make big wave in water like this," indicating by the spread of his hands the wave of water the salmon pushed ahead as they forged up stream.



"Long Jim's" father, In-na-mo-sech-ee, was chief of this land and the tribes of Indians who dwelt thereon. From Chelan to Nespelum the distance was 70 miles.

As the plains Indians looked on the buffalo as their property, a vital food supply, so the Pacific Coast Indians look on the salmon. They obtained their fish with a loose-point spear. The point was made of bone and slipped over the point of the shaft, the two being connected with a short piece of sinew. The Indian did his spearing at the falls over which jumped the salmon, or he might take a canoe and paddle quietly along the banks of the stream under which the salmon would often stop to rest. He always tried to thrust the bone point completely through the fish so that when the shaft was withdrawn, the point would remain on the opposite side. In this way, despite the great strength and fighting qualities of the fish, he could be dragged from the water.

The fish were cleaned, split in two and placed in the sun on drying racks, generally willow, over smoke fires. In a few days they were cured sufficiently for winter use.

The Indians watched over the fish in a primitive way, as shown by a remark Long Jim made to me as follows:

"Ahnkuttie, Indian go up close to mountains, eat berries. Salmon come up river. All sore all tired. Lay in tenas water (riffles). Indian boys wade out and help salmon up into deep water. Make 'um hyas muck-a-muck (lots of food)." Meaning, of course, that the salmon would go on up to spawn and thereby produce more salmon and more food.

"When Injun rule all this illahe (land)," Long Jim continued, "lots salmon, lots deer, lots beaver."

"When white man come long ago," I asked, "what he give you for beaver skin?"

"White man bring fire gun," the Indian answered. "Stand fire gun straight up. Indian lay dry beaver skin on ground beside fire gun. Lay another on that one. Then lay another on, and another and another till pile of beaver skin same level as fire gun.

"Indian sell 'um skins, sell 'um cayuses, sell 'um cow, sell 'um lots things but halo (not) sell 'um illahee (land)."

The last remark was the very one for which I had been waiting so I quickly followed with the question:

"Why not sell land?"

The Indian sprang to his feet. Extended his arms up and down the course of the Columbia and in the most poignant, forceful oratory I have ever heard, he said:

"A-a-a-ahnkuttie, Great Spirit gave all this land from Chelan to Nespelum to my people. Gave them this land to use. Great Spirit told them not to sell it, but to keep it for themselves and their children, and their children's children as long as the sun shone and the waters ran.

"My father, In-na-mo-sech-ee, was chief of this land and the tribes of many Indians who dwelt thereon. Many times he tell me that the white man try to persuade him to treaty this land away, and as many times, he refuse to do so. Then Chief Moses come across Columbia River over here. Chief Moses is a thief and a fool. He treaty all his land away over there on other side of Columbia," pointing to what is known as the Big Bend country. My swarthy informant continued:

"Moses go to Washington, D. C., with Colonel Howard. Have much big wa-wa (talk) there. They give him one thousand dollars, and the right to bring his people over here and be chief of the land this side of the Okanogan River. All the rest of my father's land he treaty away to the white man. He have no right to do this. White man have no right to make him chief over my father's land," said Long Jim vehemently, a wild gleam lighting his black eyes, as he continued:

"In old days, before white man come, if Moses come over here as he did—Ah-h-h-h, big fight then," describing it by going through the motions of pulling back the string of a bow and letting the arrow fly. Its action he described by sticking the point of his finger into his chest, a convulsive heave of his body and the one uttered word, "mamaloose" (die), gave eloquent testimony of what would have happened to Moses and his followers.

"But," Long Jim continued, "they could not fight then. White soldiers were there. Then so few of my father's people were left. Chelan tribe nearly all dead. Methow tribe dead. Just few Okanogans left." This was said as dispassionately as though he were talking of his cattle.

"Long Jim," I asked, "why so many of your people die then?"

He turned his black eyes on me in a baleful way.

"My father and mother tell me," he answered, "that white man bring sick peoples' blankets and give to Indians who were holding hi-u hee-hee (jubilee picnic) at Rock Island. Pretty soon Indians get hi-u sick. Die—die everywhere. Some run away into hills. Women gather herbs, make medicine. No use. Indian can't get away from bad sickness. All same when weasel grab rabbit by throat, rabbit jump, jump all round, run into bushes, no use, can't get away. Pretty soon die. All same Indian die. Mebbe father, mother die. Little children eat grass, berries, anything. Some live, some die when winter come."

It was strange indeed to hear the Indian relate such a terrible tragedy in such a calm manner. The emotion he displayed was as negligible as if speaking of the wild horses on the hills above us. But that is typical of the

(*Concluded on page 14*)

Does Tobacco Injure Mental Efficiency?

Colleges Are Confronted by the Problem of the Nicotine Habit in Students

By IRVING FISHER

Professor of Political Economy, Yale University.

Copyright, 1924, by Irving Fisher.

In the preceding article Professor Fisher showed that there are irreparable losses, from tobacco using, in deleterious effects upon the heart, blood pressure, arteries, nervous system, eyes, physique, upon industrial output and business efficiency and probably upon longevity and death rate, and the increase of such affections as tuberculosis and cancer.

The Present Problem

THE smoker who has followed the first article may be inclined to say, "I suppose you are right in claiming that tobacco injures the body. But I believe that, taken in moderation, it is only slightly injurious and that its benefits to the mind are great enough to outweigh the small injury done."

Our next task, therefore, is to find the mental effects of tobacco.

Tobacco and Mental Efficiency

An exhaustive study of this subject was made by Professor M. V. O'Shea, of the University of Wisconsin. He found that tobacco does not seem to be detrimental to the mental efficiency of some individuals, but that it is definitely so for others. He points out, however, that it is necessary to determine whether or not capable men and women who smoke would achieve by abstinence more, and on a higher plane, than they do now.

The fatigue and efficiency of smokers in a strenuous mental occupation were studied in 1920 by J. P. Baumberger and E. G. Martin, on a group of Morse-code telegraph operators. The heavy smokers showed a higher output rate at the beginning of the day than the light smokers, but their rate fell off more markedly in the later hours, and their production for the whole day was definitely less than that of the light smokers. The heavy smokers also showed less ability than the light smokers to respond to an increasing pressure of work in the late hours of the day.

The effect of tobacco smoking on mental efficiency was also studied by Arthur Dermont Bush, M. D., instructor of physiology in the University of Vermont. A series of 120 tests were made in several different psychic fields of each of fifteen men. These tests showed that tobacco smoking produced a 10.5 per cent decrease in mental efficiency.

Effect on College Students and Schoolboys

The tobacco problem in colleges and universities was very thoroughly studied by Professor Bruce Fink, of Miami University, Oxford, Ohio. The following comparative records of smokers and non-smokers were found: Non-smokers, 108.2; light smokers, 103.3; medium smokers, 99.7; heavy smokers, 77.7.

Only about 5 per cent of the high-stand men at Yale University used tobacco, according to a study made by Dr. Seaver through a period of years. He also found that the smokers who entered Yale averaged fifteen months older than the non-smokers.

Careful studies by Dean Hornell, for two years, of men attending Ohio Wesleyan University showed that non-smokers succeeded in obtaining 84 per cent of the high grades, while smokers obtained only 16 per cent of them.

At Columbia University, Dr. Meylan found that 115 smokers, during two years, averaged 62 in scholarship, while 109 non-smokers averaged 69.

At Clark University, Professor Clarke found that in [illegible] years about one and one-half times as many smokers as non-smokers dropped out of college, or took an extra year to finish, and that students who began smoking after entering college were 10 per cent lower in scholarship than those who remained non-smokers.

Much Smoking, Little Learning

ANOTHER study at Clark University, by Cora Frances Stoddard, showed that even athletics did not give the smokers a lead in lung capacity, which with them was less. Smokers had a higher scholarship on entering, but the final records showed that the non-smokers gained 2 per cent in scholarship, pushing up above the mark the smokers originally reached, while the smokers lost 8 per cent in scholarship, making a contrast or divergence of 10 per cent.

Dr. George Lewis stated that in fifty years no tobacco user had taken first honors at Harvard. An investigator at Bowdoin College reports that excessive smokers are uniformly poor scholars.

In Professor O'Shea's study, school records, examined over a long period of time, showed that tobacco was a detriment to scholarship.

In a high school investigation by Richard L. Sandwick, 77 boys who had never smoked had an average grade of 84.5; 24 boys who had quit smoking had an average grade of 80.5; 55 habitual smokers then in school had an average grade of 76; and 45 habitual smokers who had recently quit school had an average grade of 69.

The relation of the tobacco habit to the character of school work was shown by H. L. Smith, superintendent of schools, Bloomington, Indiana, by a study of 950 pupils. He found that smokers were distinctly older than non-smokers, having failed in their work much more frequently; that smokers were doing distinctly poorer work than non-smokers; and that smokers were disciplined much more frequently and for more serious offenses.

Other factors, in addition to tobacco poisoning, clearly enter into these lowered scholarships of tobacco users. In this connection Professor O'Shea says: "The probabilities are that in the case of high school boys there is a direct drug effect of tobacco which slows down the mental processes. But granting that the drug effect is negligible, if tobacco induces habits of intellectual relaxation or lassitude, the outcome is just as disastrous to efficiency in school tasks as if it directly impeded mental work."

In a study by Dr. Meylan at Columbia University, a close relation was found between smoking and membership in fraternities. The scholarships of fraternity members were investigated and found to be below the average of the college as a whole.

Pleasure from Tobacco Using

Whatever may be the financial and physiological losses to be recorded against tobacco, its users testify to a "mental solace," or "psychic income." Professor Farnam designates this mental satisfaction, obtained from the use of tobacco, by the medical term of euphoria, a feeling of well-being.

Boys Trying to Be "Manly"

THE contention of Dr. S. Dana Hubbard, of the New York City Health Department, is that "the genesis of the tobacco habit is scientifically rational, and, like all things in nature which persist, must rest upon a valid basis."

The Tobacco Habit and Advertising

But let us consider what are the forces that are making the tobacco habit "persist." One force is the money profit which the smoking habit brings to the pockets of a few men. For this profit, they spend vast sums in advertising, to keep the public in a constant state of stimulation with the idea of smoking.

Anyone doubting that selfish commercial interest is at the bottom of the great spread of the tobacco habit should read an article written by the managing editor of one of the tobacco journals, in which article he tells how the tobacco industry within ten years increased the sale of its products by 300 per cent. He says: "That the force of advertising has been the greatest factor in developing and controlling cigaret sales is not only admitted by every responsible man concerned with their production and distribution, but also should be apparent to the routine observer . . . . Most of the big gain has been scored since 1917, when something over thirty billion cigarets were made. Most of the biggest advertising has been done since that year . . . . The jolly old patriarchs who made a total of nineteen million cigarets in the year 1865, when the first 'tarnation' cigaret tax was enforced, must do some grand and lofty tumbling in the cosy National caskets every time they hear of present figures."

The Force of Example

The force of social limitation appears to be a strong factor working for the profit of those who campaign for smoking. Dr. Henry Churchill King, president of Oberlin College, in a pamphlet entitled, "Why I Am Opposed to Compulsory Smoking at Oberlin," states: "The non-smoker is in various ways, some subtle and unconscious, and some rather forcible, made to feel that he is taking a pharisaic attitude, is unsympathetically puritanic, standing apart from his fellows, distinctly unsocial, and hardly welcome in intimate gatherings. Even when unvoiced, there is pressure on the non-smoking student, especially the new younger man, to 'be a good fellow,' to come in with the rest, to give up this difference which marks him, and definitely to join the ranks of the smokers."

As an example of the force of imitation, we have the phenomenon of women imitating the smoking habits of men. The tobacco journalist, referred to above, estimates the extent of the female consumption to be as large as was the total consumption by men twenty years ago. He states, with apparent gratification, that this amount added to the industry "from other sources" (as the income tax blanks say) is not a trifling business!

Smoking is also kept alive very largely by the force of example in the home. The boy apes his elders, to be "manly." Through imitation and through advertising the tobacco habit spreads from one generation to the next and from country to country. Once implanted, it becomes fixed through drug addiction.

President Emeritus Charles W. Eliot, of Harvard University, tells of his experience in China when the British American Tobacco Company was giving away cigarets "by the million," wherever its wagons or its porters carried them. He states that the company was thus very successful in introducing the new habit among the Chinese, and adds, "Thus the Christian nations confer the benefits of civilization on the Orient!"

"The Little White Slaver"

The spectacle of a country held firm in the grip of tobacco interests, and enslaved by the drug craving which is created by the tobacco, to produce financial profit for a few, is offered by Spain, where cigaret smoking is almost universal among the men. Professor Roman made a special investigation of smoking in that country. "The waiter in the hotel, while serving you, is smoking," he says. "The conductor on the train is smoking while collecting the tickets. The agent selling the tickets is smoking. The man carrying your baggage sets it down on his way to the hotel to relight his cigaret. Your guide among the city monuments smokes all the time. It is safe to say that a majority of the priests whom you meet coming from and going to the churches and cathedrals are smoking cigarets. Priests smoke in the sacristy, and in inside rooms of the cathedrals and churches. I saw ashes and ash trays everywhere . . . . In the famous cathedral of Toledo I saw a priest smoking, dressed in the beautiful white vestments for celebrating mass. A priest will sometimes use the same fire with which he lights the candles on the high altar to light his cigaret.

"The Spanish Tobacco Company is a group of inside politicians," Professor Roman also states, "a favored rich class, growing still richer at the expense of the whole people . . . . Civilization is greatly retarded in Spain. Taxes are still farmed out. The collector collects all he can, and turns in some of it to the government. Beggars are numerous everywhere."

Forces Against Tobacco

The force of scientific evidence, the force of commercial interests, desiring efficient employes, the force of self-interest and the force of parental affection are all against the "little white slaver," as are educational influences in schools and colleges, and in life insurance companies to whose interest is the maintenance of good health among policyholders.

Legislative Condemnation

That the use of tobacco is regarded as a loss to the youth of our country is substantiated by the fact that every state in the Union has definite legislation protesting against the use of tobacco, according to information given me by Professor Roman. Two states have placed the sale to, and use of, tobacco by minors under "offenses against morality and decency," ten states under offenses against public health, five under offenses against children. In Louisiana and New Mexico the legislation thus far deals only with protection against fires from smoking, but in all other states the sale to, and use of, tobacco by children is considered a "misdemeanor."

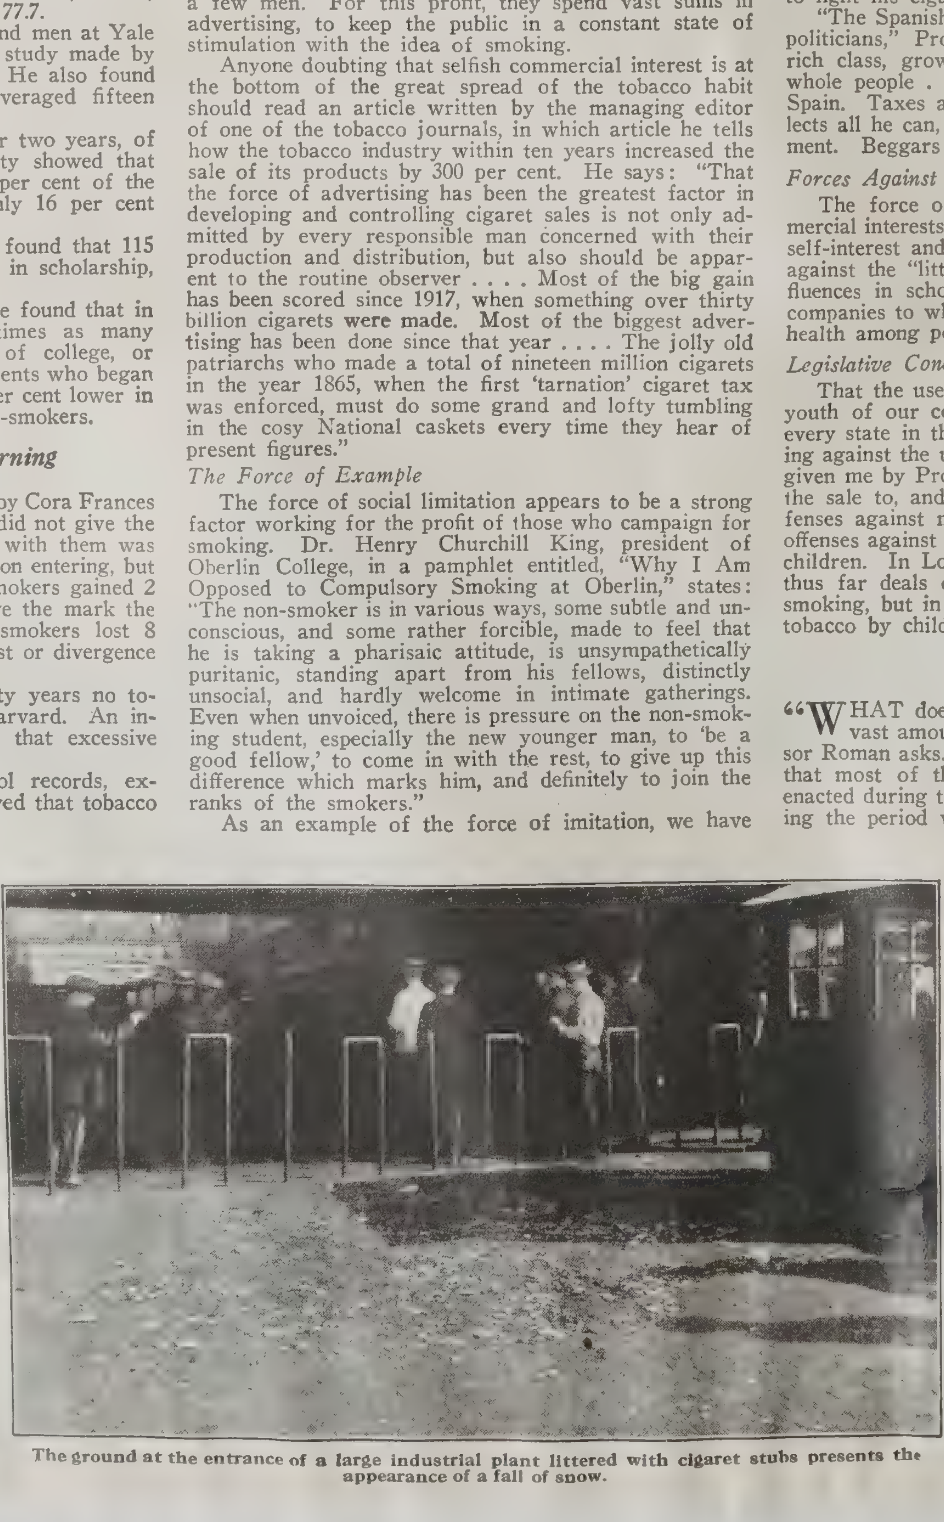
State Legislation

"WHAT does this national protest, indicated by the vast amount of state legislation, signify?" Professor Roman asks. "It is especially striking when we note that most of the legislation against tobacco has been enacted during the last ten or fifteen years—that is, during the period when the increased advertising and sale of tobacco is supposed to have been sweeping the whole country.

"It is also worthy of note that within the last few years systematic campaigns against the use of tobacco are being conducted in some of the high schools of our large cities, such as Kansas City and Los Angeles. These are typical. In Kentucky and West Virginia the legislation provides that there shall be no smoking at all in school buildings, on school grounds, or in any buildings or parts thereof that may be used for school purposes. Both the states of Kansas and Utah prohibit by law the advertising of cigarets or cigaret papers on any street sign, placard or billboard, or in any package of merchandise, store window, show cases, or any other public place within the state. In Iowa, 'No bills, posters, or other matter used to advertise the sales of intoxicating liquors or tobacco shall be distributed, posted, painted or maintained within four hundred feet of premises occupied by a public school or used for school purposes.'

"As to whether tobacco is con-

(Concluded on page 13)



The ground at the entrance of a large industrial plant littered with cigaret stubs presents the appearance of a fall of snow.

Some Ups and Downs on the Atlantic

Life on the Ocean Wave Has Its Thrills as Well as Touches of Comedy

By ALLAN L. BENSON

WHAT is life aboard an Atlantic liner? What does it mean to spend a week at sea?

Come along and you shall have all of your questions answered. You have got your passport and your steamship ticket. You walk up the gangplank and are shown to your stateroom. You notice a little railing at the head of your bed. You wonder what that is for. You think a minute. It looks like the railing of a child's bed. You know children are railed in to keep them from falling out. The answer comes to you. You are railed n to keep you from falling out, because the ship is going to do some rolling before you reach the other side. In a flash, you think what a scoundrel the man was who old you that all of those big Atlantic liners are as steady as the Brooklyn Bridge.

You think you will walk out on deck and see what s going on. On your way out of your stateroom you rip over the threshold of the door. For the first time you notice that the threshold is about eight inches high. What a way to make a threshold! You wonder why ship's carpenters are so stupid. But they are not stupid. Then or a little later the answer comes to you that hresholds are built high so that if waves come on deck the water will not come into your room.

You plod your way along a hall until you come to the place where passengers are still coming up the gangplank. On and on they come—passengers, visitors and messenger boys. Most of the messenger boys are carrying great green baskets of fruit. You might think these baskets cost $2 or $3 each, but they cost from $25 to $50 each, depending on the size of the basket and the quality and variety of its contents. If you are lucky, when you go back to your stateroom you will find one of these baskets with your name on and the card of a friend.

While the big electric cranes are lowering carloads of runks into the hold, you watch the people who are standng around. Your eyes soon settle upon a matronly ady and a young woman who is apparently her daughter. Every little while the matronly lady convulsively throws her arms around the girl's shoulders and kisses her on one cheek and then the other, again and again. After his has taken place about six times you wonder what t is all about—but it is about nothing. The girl is imply going abroad and is glad of it. She hasn't a ear in her eye and will evidently be able to do quite well without her mother for the next few weeks.

A six days' spell of reading.

You tire of looking at these two and your eyes turn o another couple—a young woman and a young man. They are very serious and very quiet. They walk around, utterly unmindful that anybody else is aboard. You wonder why one of them is not sad, too, and finally conclude that it is because they are both sailing. You make a mental note of your intention to keep an eye open to ee if they are both aboard during the voyage. Then you forget all about them until weeks later. A ship is o large that you cannot keep track of all the passengers.

Now you are going to see somebody! She is coming up the gangplank. All of the women around are pointing her out. She is a celebrated actress who has played all winter in New York. You have heard about her and perhaps seen her in the theater. But as she draws nearer, you see that she is not so much. Nobody would ever send her to a beauty show. She hasn't much of a face and all of her beauty comes from a box. You wonder where she got her reputation as a good-looker. While you are wondering you forget all about her, because the trunks are all in the hold and visitors are being ordered ashore. The ship is going to sail!

When a ship sails, everybody aboard probably has a different feeling. If it be your first trip abroad you will have a feeling that you never had before and can never have again. When you first notice that the ship is actually backing out of the dock you will probably feel as f you were a tooth, America a jawbone and you were being extracted. It is an awful feeling. Perhaps most persons never had it. I know I had it and it was one of the most unpleasant experiences of my life.

Your ship backs out into the river, reverses its engines and heads down the bay. One by one you pass the buildings on Manhattan that you know so well. On the other side of the ship you see the Statue of Liberty, but get no kick out of it because you know you are going to leave it. As you proceed, the land is farther and farther away on each side, but you can still see it. While you are passing Sandy Hook you recall that you are now where the great international yacht races are held. When you are out about twenty miles, you see the Ambrose Channel lightship. This is important because it is the point from which the Atlantic journey is reckoned. At sea, they don't speak of the distance between Cherbourg and New York, but of the distance between the Cherbourg breakwater and Ambrose Channel lightship. The lightship is also the place where pilots are taken on and let off. Your ship slackens to let the man who has piloted you out of the harbor get off. In a minute or two you see a fast motor boat speeding from your ship toward the pilot boat. That motor boat is carrying your pilot and from now on your captain will run his own boat.

It is soon time for luncheon. A bugle tells you when it is mealtime on shipboard. For breakfast he blows a certain kind of blast—over and over again. For luncheon he blows another kind; for dinner still a different kind. You never know one blast from another, but you know from the time of day what it is all about. You go down to the dining room and the steward assigns you to a certain seat at a certain table where you are to take your meals for the voyage. You may be placed at a table for four, or, if you are lucky, at the captain's table where there are a dozen others. Wherever you are, you will get acquainted with the others. You may like them and you may not.

On one voyage I was placed at a table with three men. One of them stayed two meals and disappeared. The next day I met him on deck and he spoke to me. Almost the first thing he said was that he had asked to be moved to another table. I asked him what was the matter.

He replied: "I could not stand those Englishmen."

As they were both very nice men I was a little amazed. Pretty soon I fished for his nationality with the remark: "I suppose you are from New York."

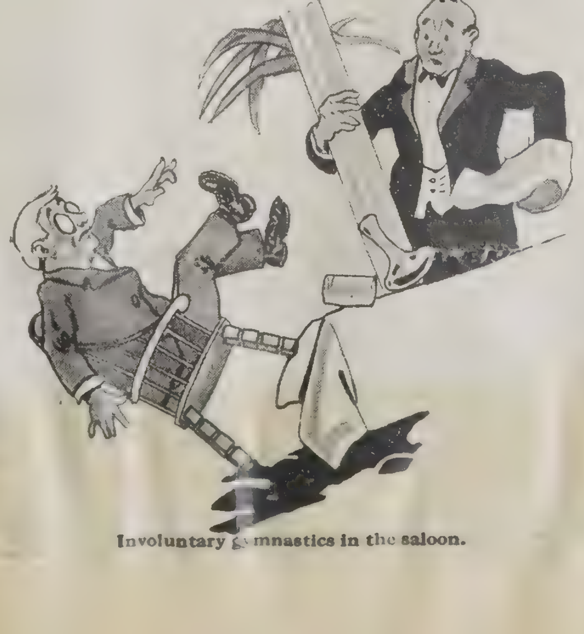
"No," he replied, "I am from London; I am an Englishman."

I laughed in his face. One Englishman who could not stand two others! Then he told me all about it. The other two Englishmen were "in trade." They were manufacturers. Such cattle were not for him. All during the voyage I saw him sitting in a deck chair, reading a book and smoking his pipe in solitary grandeur.

After luncheon you may choose from a variety of activities. You may go to the reading room, take books from the ship's library and read. You may go to the smoking room and smoke, drink, play cards with friends or gamble at poker or whist with cutthroats. Or at 4 o'clock you may go to the lounge and hear a concert by the ship's orchestra while tea is served. Each of these rooms is large and splendidly furnished. Wherever you are you will be comfortable—unless the gamblers get you. Not that anybody need gamble if he doesn't want to.

After dinner almost everybody goes out on deck and walks half an hour or so for exercise. While on deck, you may see a beautiful sunset. The best sunsets come before or after a rain. If the clouds are banked just right and are of the right texture, the display is gorgeous. The sky is shot with every shade of red, yellow and blue. The sun may get behind a cloud that turns the sun a dark red and changes its shape. During five minutes, I have seen the sun look like a balloon, a parachute and an old-fashioned silk lampshade.

The sun drops below the water line and night steals on. Soon it is dark. With darkness, a man goes to the prow of the ship and takes up his lonely vigil. It is his business to peer forward into the darkness and see that your craft does not run down another ship—or an iceberg. Nobody crosses the ocean any more without thinking of the *Titanic*. Sailors think of it, too. Ships have changed their course since the *Titanic* went down. They no longer go up along the Grand Banks of New Foundland and then dart over to the other side. They sail from New York on a course that is a little south of east. They hold to this course for three days, then take a sharp up-shoot to their European destination. On the westward voyage, the course is reversed. This brings them far south of where the *Titanic* went down. Yet it is not far enough south to eliminate all danger. An iceberg occasionally gets away, although America and Great Britain each keeps a craft in the iceberg region to look out and notify shipping by wireless. Sometimes one of these ships will hook on to an iceberg and tow it out of the steamship lane. But notwithstanding all of these precautions, ocean steamships look out for themselves. When they are in the region where icebergs may be, the temperature of the water is taken every hour and at night two lookouts instead of one are in the ship's prow. A sailor drops a leather bucket overboard, draws up some water and puts a thermometer into it. An iceberg cools the water for miles around. This seems strange, but sailors say it is true. Sailors say they can even smell icebergs.



Involuntary gymnastics in the saloon.

You take a final look at the surrounding blackness before you go inside. You hear the swish of the waves and the steady purring of the ship's turbines as you drive through the water. By the scanty light that streams from the portholes you see a little of the white-capped waters that are curling around you. All else is black.

After dinner some passengers dance, or listen to music in the lounge where the orchestra plays, while others gamble. The big event on a liner in the evening is the selling of pools on the ship's 24-hour run that will end at noon the next day. This takes place in the smoking room. The room is full, some of whom come to gamble and the others to see the show. There are as many women as men, though men do most of the betting. You see them all sitting around at tables, drinking and smoking. Some are drinking after-dinner coffee and some after-dinner booze. Most of them are in evening dress.

Intimate confidences.

About 9 o'clock a sporty gentleman hops aboard a chair and announces that he has been asked to perform as auctioneer. He then explains what selling pools means. It is this: Twenty persons form the pool, which means that each night he pays into the pool five pounds, or about $90, and is allowed to draw a slip of paper bearing his name. These papers are all put into a hat each night and drawn out by a blindfolded man. The first slip that is drawn is given the lowest number of miles that the members of the pool have voted to be the low-range of what they believe the ship will run the next day. For instance, if they have agreed that the pool shall range from 580 to 600, the first slip will be numbered 581.

After these slips have been numbered, they are auctioned off, one at a time. The man whose name is on the slip may or may not buy it, depending upon whether, in his opinion, the number is or is not likely to represent the mileage that the ship will make. On a big ship, pools sell at prices ranging from $60 to $125 each. Also, they bet on "high field" and "low field." Betting on low field means that the bettor wagers the ship will run fewer miles than the 581 to 600 mile range that has been agreed upon. High field means that if the ship runs more than the range agreed upon, whoever took high field will get all the money.

The selling of the pools takes about an hour. On a big ship the pot amounts to $2,000, or more. Usually there is at least one really interesting character in the group. I recall one on our eastward trip. He was a titled Englishman about 40 years old who had a commission in the army, citations for distinguished services in the war, an American wife with money and apparently about everything one might need to be happy. But the best thing about this Englishman was not what he had but what he was. Obviously he had never done a day's work in his life. Plainly he was a member of the parasitical class. But he was such an exceedingly good fellow that one forgot all such things. Always in motion, always smiling, he radiated happiness wherever he went. In the evening he was always in the smoking room betting on the ship's run. One evening he bought eight pools for which he must have paid in the neighborhood of $1,000. He had peppered the range that seemed likely to include the winning mile until it seemed as if nothing could beat him—but the next forenoon we ran through fog for four hours and a man who had put up only $60 won the whole business. But this did not interfere with the happiness of the Englishman. He continued to smile, to play pranks and to make everybody around him like him. I saw him pitching quoits on the deck the next afternoon. With the short stub of a cigar in his mouth he pitched one after another, none of which went on the peg. Then in mock exasperation, he slammed the last one down hard, as if in a rage—and burst out laughing.

Ordinary persons sometimes do very strange things at sea. For instance, an Englishman one day sat down beside me in the smoking room, started a conversation, and within fifteen minutes was telling me all about his troubles with his wife. What he wanted to know was if I did not think it would be a good thing for a man 50 years old to marry a young woman and raise a new family for the purpose of keeping himself young. If you can beat that for a question, go to it! A day or two later, another smoking room companion told me, fifteen minutes after we met, of a novel method he had adopted to cure his wife's nervousness. He sent her to the country and had her devote a certain number of hours each day to driving nails in a block of wood. He figured that her trouble arose from the fact that she had had too much leisure and too little responsibility.

(Concluded on page 14)

Engineers Were Great Pioneers of Progress

Country's Big Debt to Pathfinders Who Blazed the Trail From Coast to Coast

By HARRY PENCE

NO ONE wants to waste time speculating on who won the war. It is worse than waste of time. It is mischievous. No single straw ever broke a camel's back. The final crushing overload was crushing only because of previously accumulated burdens. The opening game of the season, won or lost, is as much the deciding game as the narrowly won victory in the so-called crucial series.

Hence no one nation, no one commander, no one arm of the service, won the war. It was a case of nobody in particular, everybody in general.

One thing, however, is certain. Whatever factors might have been dispensed with without change in the final result the absence of the engineers would have been fatal.

The engineers are not clamoring for recognition—nor are they getting very much of it.

Had George Washington not been a competent engineer the Continental Army might have made a different record in the American Revolution.

What is not understood, nor even suspected, is that the upbuilding of this country, the extension of its western frontier, the development of its commerce and much of its industry are due in a large measure to the labors of United States Army engineers or to men trained to be military as well as civil engineers who, upon the completion of their education, found no place in the army and were forced into civil life.

What Washington Said

WASHINGTON knew, perhaps better than most of his contemporaries, that the new nation could achieve coherence at home and command respect abroad only by developing a government capable of enforcing its laws and a potential military strength to withstand encroachments. Encroachments of the strong upon the weak was even more the spirit of that age than of this.

He was a preparedness advocate more strenuous than most of his successors. Abolishing warfare by outlawing it or by any other process was not seriously considered in his day.

"To be prepared for war is one of the most effectual means of preserving peace," he told Congress.

And Congress responded by scrapping the army and making no provisions for the possible recruiting of another one till the threat of trouble with France eight years later.

Washington recommended the establishment of a training school for army officers. Not till nearly two years after his death was this done. In 1802 the Corps of Engineers of the United States Army was organized on a permanent basis and the act of Congress creating the corps authorized the establishment of the United States Military Academy at West Point.

But West Point was not popular with Congress, nor did the War Department pay much attention to it.

When, however, Congress realized that the war was imminent apathy gave way to feverish haste. The management of the academy was reorganized, a maximum of 250 cadets was authorized, the courses of instruction prescribed and age, mental and physical requirements fixed for admission.

This was done too late to provide capable officers for the second war with Great Britain but of the eighty-eight graduates of the academy sixty-four took honorable part in the conflict. Ten were killed in action, a similar number were wounded or died of other causes and a round dozen won official citations for efficient service as well as bravery.

The "Old National Pike"

THE war with Mexico in 1848 was the first in which the graduates of West Point took an important part. After the conflict General Winfield Scott, who was not himself a West Pointer, said, "I give it as my fixed opinion that but for our graduated cadets the war between the United States and Mexico might and probably would have lasted four or five years with, in its first half, more defeats than victories falling to our share; whereas in less than two campaigns we conquered a great country and a peace without the loss of a single battle or skirmish."

But long before the outbreak of the Mexican War the United States Military Academy had made signal contributions to the upbuilding of the country. The graduates of West Point constituted the only class of "home grown talent" possessing engineering knowledge and skill. The same principles underlie both military and civil engineering, and instructions at West Point included thorough training in these sciences.

As Congress pursued a policy of holding the army to the irreducible, minimum vacancies in the regular line were not sufficient to give places to all the graduated cadets. Many of them were assigned to such pioneering work as the exploration of the western frontiers and the reconstruction of our obsolete coast defenses. This naturally led to road building and the erection of lighthouses at dangerous points on the coasts and Great Lakes.

The earliest major accomplishment of the Corps of Army Engineers was the projection and construction of the "Old National Pike," a highway famous in the early days for its unusually excellent surface, its width, its celebrated taverns. It began at Cumberland, Maryland, the western end of the older Braddock's Road from Washington, and penetrated the great West to St. Louis. It was the main line of travel from the Middle West to the National Capital. It ran through and became a considerable factor in the early growth of Uniontown and Washington, Pennsylvania; Wheeling, West Virginia; Zanesville and Columbus, Ohio; Richmond and Indianapolis, Indiana; Marshall and Vandalia, Illinois and St. Louis, Missouri. This old road, built entirely at government expense, was begun in 1806, primarily as a means of transporting troops quickly to Mississippi River points and farther westward, but under the care of United States Army engineers it served better the cause of peace and progress than that of war. In 1837, it was turned over to the various states and many stretches of it fell into bad repair. The advent of the automobile has brought about its reconstruction and it is now one of the country's most celebrated, popular and useful motor highways.

Explorations of the comparatively unknown West, map making of all sections of the country and the discovery of the natural resources of the nation proved so important that a corps of Topographical Engineers was organized and served till its amalgamation with the regular Corps of Engineers at the outbreak of the Civil War.

A sizable volume could be written upon the work of this special corps, commanded by army engineers and composed of army and navy men and such civilian aids as were necessary to keep the work up to the highest standard possible within the appropriations for its maintenance.

John C. Fremont, the famous "Pathfinder," did his best work as a member of this corps and other topographical engineers braved the hardships and dangers of the frontier to explore and make maps which greatly aided the army in conflict with the western Indians.

Waterway Construction

THIS work, with that of the geodetic and hydrographic surveys, have, since the establishment of civil, technical and scientific school training in those lines, passed out of the hands of the army engineers, but all owe their origin and development to army men.

The United States Army engineers brought the lighthouse service to a high degree of development before it was transferred from their care. Their original surveys determined the locations of lighthouses and they planned, directed the construction of and disbursed the appropriations for practically all the famous lights on the coasts and lakes, many of which were engineering feats of the first magnitude.

The United States Engineers were, in fact, the only class of men possessing the knowledge and skill necessary for such vitally important work.

Many roads of great importance to the early settlers, with all the bridges necessary to carry them across streams that would otherwise have blocked the immigrants' path, were located and built by army engineers, and their next signal contribution to the expansion of the country was their part in canal building.

The celebrated Erie Canal, the original of the New York Barge Canal, was projected, surveyed, planned and, in part, constructed by army engineers although the waterway was entirely an enterprise of the state of New York. It connected Lake Erie with the Hudson River and through it the Atlantic Ocean.

Under Secretary of War John C. Calhoun, not only were army engineers assigned to a wider range of public works, many of them entirely civil, but soldiers were also given small extra pay and extra allowances of whisky—a universal custom in those days—for their work as laborers under the direction of officer engineers.

The construction of the Erie Canal and the application of steam to boats stimulated navigation on the Great Lakes. The Lake Survey of the Corps of Engineers of the United States Army was begun in 1841 and by 1885, at an expense of $3,000,000, all the lakes had been surveyed, mapped and charted and there was placed at the disposal of the masters and pilots of vessels navigating these waters information indispensable to their safety.

The surveys revealed the shoals, submerged reefs and rocks and other danger places and means to protect navigation from them became the work of these engineers.

Only the more important features of this great work can be outlined, and these very sketchily.

Originally, navigation on the Great Lakes was restricted and its development impeded by the shallowness of the waters in the rivers connecting the lakes. Canada had endeavored to open Lake Superior by means of a set of small locks in the St. Mary's River. These permitted the passage of boats of nine feet draft but these locks were destroyed by United States troops in the War of 1812. As their chief value was maintaining communication with fur traders in the Hudson Bay district, demands for their reconstruction were not insistent. In 1837 the State of Michigan undertook surveys for a canal and locks at this point and a contract for their construction was let the following year. This waterway was to have a depth of ten feet and was estimated to cost $112,544, but little work was done upon it because the state and the national authorities came into conflict and the Federal military ejected the workmen.

This is one of the very few instances of United States Army obstruction of state public works and while regrettable was probably not, in the long run, unfortunate, for copper had been found in the Lake Superior region and the proposed undertaking was soon found to be entirely inadequate.

Improvements at Sault Ste. Marie

MICHIGAN persisted and sought Federal cooperation and financial aid. This was obtained in 1852 when a grant of public lands was made to defray the expenses and army engineers made plans for a canal and locks eleven and one-half feet deep. A private corporation of builders and bankers undertook the work for the land and completed it in 1855 at a cost, to them, of a little less than one million dollars.

This canal and its locks remained under the control of the State of Michigan until 1872, when increasing traffic and the need for larger boats to transport it made the waterway again unequal to requirements and the folly of the State of Michigan undertaking their reconstruction on enlarged scale became manifest. The government took them over and they passed to the control of the United States Army Corps of Engineers.

General G. C. Weitzel planned and constructed a new canal and locks of seventeen feet depth at a cost of approximately $3,000,000. These were put into commission in 1881 and used jointly with the original Michigan locks, which were demolished in 1888 to make way for the later and larger Poe locks, the work of General O. M. Poe, of the Corps of Engineers. The Poe locks provide a depth of twenty-two feet, cost more than $4,000,000 and were completed in 1896.

The American improvements at Sault Ste. Marie have cost approximately $15.000,000 and of them a recent writer has said, "No similar expenditure of capital by any state or nation has conferred such vast benefits to so wide an area and so extensive a population."

But the enterprise required brains as well as money and the engineering knowledge and skill were provided by members of the Corps of Engineers of the United States Army.

Lake navigation improvements which began early are still in charge of United States engineers. Other lines of work have been transferred to other departments. The army men were the first explorers, map makers, lighthouse, highway and canal builders.

Army Engineers in Railroading

ARMY engineers were also pioneers in railroad projection, planning, construction and even operation.

Two West Pointers planned and built the Baltimore and Ohio, the first railroad in the United States, and after its completion successfully operated it. One of them designed and built the best locomotive in use in his day and acquired such reputation at home and abroad that he was called to Russia by the Czar to direct the construction of the government railway from St. Petersburg to Moscow.

In other railroad enterprises army engineers were not usually so prominent, but they planned or were consulted in the planning of nearly all the undertakings in the era before the Civil War.

Their part in the construction of the great transcontinental railroads is squarely set forth by General Grenville M. Dodge, builder of the Union Pacific, the first of these gigantic undertakings.

General Dodge was a graduate of West Point who, like many of his fellows, found no place for his highly developed talents in the army or its civilian occupations and went from the academy to practice as a civil engineer. He won a place for himself in the industrial world but laid aside all else to enter the Union Army at the outbreak of the Civil War. He served with distinction not only in strictly military operations but also in such exploits as the rapid reconstruction of destroyed rail lines and bridges which facilitated the movements of troops.

Mr. Ford's Page

WHEN art is divorced from utility there is something wrong. The ancient Greeks understood this and kept it in view in all their works. This is the secret of the chasteness and beauty of their architecture.

In their great temples and other monuments, the remains of which excite the wonder and admiration of the world today, and that serve as models for the modern designer, the massive columns and other features were proportioned so that strength and beauty should go hand in hand. These columns always act as supports; they are not erected merely for the sake of display; cornices and entablatures are always an essential part of the structure, and brackets invariably hold up something. Every detail is constructive, and where carving is used it is generally to fill up the bare space in a frieze or to be enlisted as a component part of the edifice, as in the case of the statues called caryatids, which take the place of pillars.

Ruskin stresses this point, and strongly condemns the overloading of a building with meaningless ornament. It was in this that the Romans, in their love of display, fell short of the Greeks. The beauty of the design was lost in a meaningless mass of ostentatious embellishment, and in the contour of their moldings they employed arcs of circles in place of graceful flowing curves derived from conic sections.

> *BECAUSE a thing is useful is no reason why it should be ugly. Nevertheless, in this utilitarian age an opinion exists that just because a thing is useful it is quite superfluous to make it ornamental as well. This is a mistake, for when any object is pleasing to the eye its usefulness is increased, and the satisfaction which its usefulness gives is supplemented by the pleasure which its appearance imparts. The trend of modern thought in the creative field, whether it be the designing of a dress, the building of a factory, or the planning of a new town, is to introduce, as far as is compatible with utility, those characteristics which delight the intellect by their grace and beauty as well as by their fitness. To render anything "a joy forever" it is essential that the elements which are in opposition to good taste be eliminated.*

Utility sometimes overshadows or obliterates art, but there is no reason why this should be so. Even the plainest design can be chastely conceived. Art when allied with good taste is always pleasing and has a refining influence which cannot be overestimated.

For years it has been recognized by modern employers that suitable environment has an important bearing on the efficiency and general welfare of their workers. A man will accomplish more in pleasant surroundings than if hemmed in by hideousness.

In the Middle Ages all workmen were artists and designers. The grand old cathedrals of Europe, which today excite the wonder and admiration of travelers from the New World, were erected by handicraftsmen of this type. They were imbued with high ideals, and they went direct to nature for the models which they reproduced in wood and in stone.

Full-sized drawings and details which had to be copied without deviation were not furnished the craftsman in those days; he took his ideas direct from the plants and trees that grew near the job and applied them with surpassing skill to a base, a shaft, a capital, or a cornice. In this way those medieval buildings acquired a character and distinction which has never been excelled.

There is no reason why any true workman should not be a true artist as well, for art is not foreign to even the most humble occupation. Without perhaps being aware of it, every man who takes a pride in his work is more or less of an artist.

There was once a street sweeper who was asked his opinion of a new hand. "He's all right for plain jobs," replied the expert, "but when it comes to sweeping around lamp posts and fancy work like that—he has a lot to learn."

If a job is worth doing at all it is worth doing well. This sounds like a platitude, but it is as true today as it was when the Parthenon was set on the Acropolis at Athens. The man who takes a conscientious view of his work is an artist just as much as the sculptor who by the aid of his chisel uncovers the angel which Michelangelo said was concealed in every block of marble. The fact that Michelangelo was a painter, a sculptor, a poet, an architect, and an engineer combined, is abundant proof that art and utility are not only compatible, but are inseparable.

If form and color are carefully studied in their application to the things of everyday use, much may be accomplished in making life more pleasant. Even in the serving and dishing of the things we eat, fine art is a factor.

Primitive man had that instinctive craving for things beautiful that has come down to us through all the centuries, but in his dark cave or hut of wattles his ideas were necessarily cramped and obscure. The rude pottery which with infinite labor he fashioned for domestic use was frequently decorated with incised lines wrought into various patterns; the crude pictures which he scratched upon the rocks or on the bones of wild animals, comprised his art gallery. This is what counts today—the happy blending of the artistic and the useful.

An object of utility which is also a work of art is treasured even after its usefulness is gone, or rather when it has ceased to perform the function for which it was originally intended. It may be only the carved keystone of an arch, a brass door-knocker, or a piece of old China full of cracks and mendings; but its power to delight the eye has not vanished with its lack of utility, and so it is treasured still. True art is like radium, its luster cannot be destroyed.

No one loves ugliness for its own sake, but things beautiful, whether in nature or art, are pleasing even to the dullest mind. Of course, tastes in what is really beautiful differ widely, but so do tastes in almost everything else. It is well that this is so or everything would be reduced to a common standard in which strength and character would be lost.

It may be asked: "Is it not better to sacrifice the artistic to the utilitarian than the utilitarian to the artistic?" What, for instance, would be the use of a teapot that would not pour because of the ornate design of its spout, or what would be the good of a spade which lacerated the hands because the part that had to be grasped was richly carved? This could not be called applied art; it would be misapplied art. As soon as the decoration on an object of utility interferes with its functioning it ceases to be an object of art and is better to be discarded as a nuisance, for it is neither ornamental nor useful.

Perhaps nature is the surest guide in the choosing of color and design. No matter how multitudinous the tints of autumn, or how varied the rich mantle of summer, the colors never clash; bole and branch and leaf present an endless variety of form, but they form one harmonious whole. There are such things as "freaks of nature," but these are the exceptions that prove the rule.

It has been said that trade and industry are fatal to art; but this is a fallacy. The great lakes and the sea, aided by the magic of cloud and sky, form never-ending pictures which artists love to paint, but life and motion are imparted to these subjects by the ships of commerce passing to and fro. The fields never look more beautiful than when the harvester is at work, and at no season of the year are the orchards more lovely than when the ripe fruit is being gathered and put away.

Industry and art are, therefore, not incompatible, but sound judgment is necessary in preserving the true balance between one and the other.

The craftsmen of Egypt, who designed artistic pottery and beautiful textile fabrics thousands of years ago, never dreamed that a people so different in their civilization as the people of today would be imitating these designs in the production of modern articles of wear, and that the devotees of fashion would be calling them "the very latest thing." But the ancient Egyptians knew what they were about. They knew how to blend line and color in such a manner that it would be pleasing to the eye and in perfect harmony with the nature of the object for which it was intended. This is the combination which we seek today.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Why Not Vote!

IN THE year 1920 only about half of the qualified voters of the United States voted. Various reasons have been advanced for this, none of them very satisfactory. But there is no doubt that some voters take the attitude that there is little to choose between the different parties and their policies. Many are undoubtedly of the opinion that the candidates have been "hand-picked" and therefore not the choice of the citizens as a whole. This is bad for the country, and, therefore, bad for themselves, but in the absence of immediate effects it is difficult to convince them of this.

There are some who would make this wilful abstention a crime, and inflict severe penalties, but this is a drastic measure which would not appeal to the people at large. It would be too much like an interference with personal liberty. It is suggestive of the old saying that "You may drive a horse to the water, but you can't force him to drink." In the event of voters being driven to the poll by the power of the law, they may be compelled to vote, but they are free to vote for whomsoever they please. There is no one who can control any resentment they may harbor. They may blame someone for undue inter[illegible] with what they may consider their rights, and act accordingly.

It must also be considered that a large proportion of those who fail to put in an appearance at the polls are too ignorant to grasp the questions at issue and when compelled to exercise their privilege are apt to vote with the same blind indifference that impelled them to stay at home.

The only reasonable remedy seems to be the education of the people in the duties of citizenship and in taking a laudable pride in their country's welfare. But who is to do the educating; where are the impartial instructors who will undertake the task of directing those defaulting citizens along the right path? Free lectures might be invoked, with educative movies as part of the program. But here again there might be trouble. Who is to choose the program?

This is a matter which must right itself in due time. Nothing can be gained by coercion. It must be remembered that a large proportion of the citizens have not yet had time to absorb the atmosphere of this country, and until they do, this trouble will remain.

Italy and the League

ITALY, rather than Japan, would seem to be the motivating agency in maneuvers to have the League of Nations committed to the principle that a nation should be compelled to submit to arbitration foreign objections to its immigration laws.

Immigration, like the tariff, has always been considered purely the domestic business of countries involved. They could decree who could and who could not enter.

Japan's notes to Washington and discussions before the League of Nations on the immigration question are largely meant for home political effect.

However, American emigration is a matter of life and death to modern Italy as long as her present exceedingly high birth rate is maintained. The export of its surplus population to America and the profit therefrom have been big items in the maintenance of modern Italy. The emigrants' remittances to relatives in Italy were once the largest inflow of new money to the nation. Now all is changed.

Mussolini will be considered a failure unless he reopens Ellis Island to his people. The strange thing about the question is that the Italians consider America no longer has the right to limit immigration. They are intensely serious in their belief that we have done a high-handed and indefensible thing.

Consequently, Italy has put forth every lobbying agency at the command of her government to get the League of Nations to consider compulsory arbitration of any nation's immigration laws that are objectionable to another country.

America has come to be regarded throughout the world as a sort of profitable boarding house and is not credited with the nationalistic claims that other countries proudly maintain.

The Awakening of China

EVER since China shed its imperial robes it has been the theater of civil strife of a more or less sporadic nature. Undoubtedly the country wants a strong man; but where is he to come from? When the Manchu dynasty bade farewell to all the ancient splendor of the palace at Pekin, it was to Dr. Sun Yat Sen that it turned for a lead. Dr. Sun did his best; he probably did more in his endeavor to set China on its feet than any other man. But he was attempting the impossible.

China is a giant that has slumbered for many centuries. Giants are notoriously stupid when aroused from a prolonged debauch of sleep. China is no exception. It is still in the stage of rubbing its eyes and wondering what it is going to do next.

The vastness of the country and the lack of facilities for communication which exist in the greater part of it are important factors in the confusion and lack of understanding that exists between one part of the country and another. The giant is incoherent; he does not know what he wants. The sun of modern progress dazzles his eyes, and his actions are apt to be blind and irresponsible if no one is forthcoming to lead and direct him.

Thousands of years ago the Chinese led civilization, but they made the mistake of concluding that they had reached the summit, and so they halted and marked time, and they have been smoothly marking time ever since. But there has arisen in their ranks for the past decade or so a desire to move forward that has been taking tangible form, and the tendency has been Occidental.

The recrudescence of civil strife that has taken place during the past few weeks is nothing to be wondered at. It was inevitable. There is a suggestion that Bolshevik influences have been the cause of the present trouble. This is not at all improbable. The same thing is seen behind troubles in other parts of the world; but this is but a passing phase of the whole situation. No solution of China's difficulties can be reached until the giant is fully awake and qualifies himself for a place in the march of progress. It is then and then only that order may be expected to emerge from the present chaos.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1924, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 22nd day of September, 1924.

[SEAL] J. EMMET HALL.
(My Commission expires September 29, 1924.)

Disarmament

A SEMI-AUTOMATIC rifle is being perfected for use as a shoulder weapon, a .50 caliber machine gun is being got ready to replace the war-time .30 caliber, new trench mortars of great accuracy are nearing perfection, high-speed tanks with gun turrets are under way, and a 75 mm. field gun of 15,000 yards range, as well as other inventions, will be ready in the near future.

This is the substance of what Major General C. C. Williams told a meeting of the world's savants gathered at Philadelphia the other day. It goes without saying that efficiency in war, as long as war exists, is just as essential as efficiency in peace. There are those who go still further and assert that if the weapons of war are made terrible enough, war will cease, for its very deadliness will lead to its own destruction.

All this may be true, but it is deplorable that the necessity for the invention and use of instruments of any kind for the destruction of human life should exist. The time seems yet distant when men shall beat their swords into plowshares and their spears into pruning hooks.

But, strange as it may seem, it is not alone during the time of war that enmity exists in the world. The seeking of human life for the punishment of wrongs, real or imaginary, is not confined to the battlefield. Men who never stood up against a foreign foe in a cause good or bad follow in the path of Cain, and while certain organizations, doubtless with the best intentions, are continually crying out for disarmament, there is not a word about taking measures to stem the torrent of capital crime that is gathering volume on this continent.

The reports of cold-blooded crime that fill the columns of the newspapers day after day cause one "furiously to think," but there is no one who suggests that to put a stop to it the police ought to be disarmed. It is those who are the disturbers of the peace, those who are a continual menace to the lives and property of the community who ought to be disarmed. This is even truer of individuals than of nations. It is a form of disarmament that is still more urgent.

Mussolini's Masterpiece

WAS it not the Emperor Augustus of whom it was said that he found Rome built of brick and left it of marble? Mussolini the dictator's mind is evidently running in the same direction; not regarding a transition from brick to marble, but a transformation of the Eternal City into a city of skyscrapers such as Augustus never dreamed of, and that would make New York's biggest and tallest buildings look like bungalows.

Mussolini Caesar has engaged the services of one Mario Palanti, who has already erected several colossal buildings in various parts of the world, and he proposes to erect in Rome a building with 88 floors and 1,500 feet in height, having a frontage of 1,000 feet.

Doubtless this projected structure looks very fine on paper, but there it is likely to remain, mainly owing to two things; namely, the lack of a suitable site in the heart of Rome, and the difficulty of finding the necessary funds.

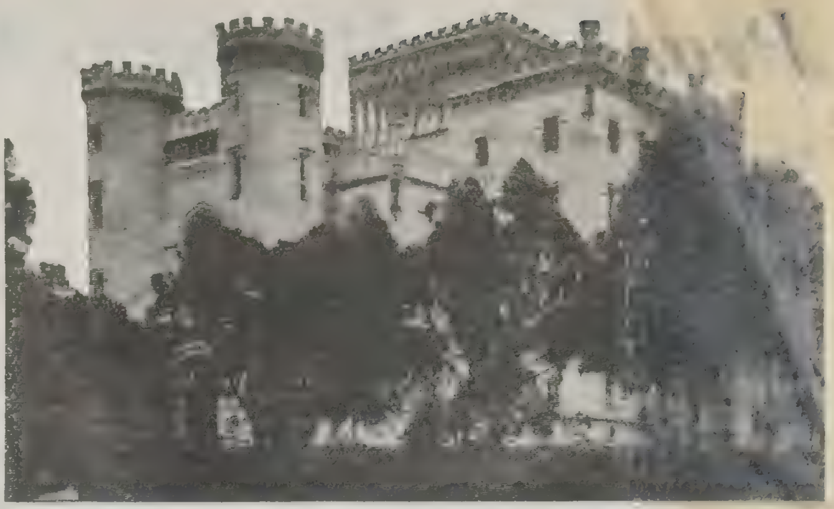
Gone are the days when the Caesars were able to command cheap labor in the shape of an unlimited supply of slaves of all nations, who were fed on radishes and garlic and clothed not at all; gone are the days when they could commandeer marble quarries and whole forests of timber trees. Mussolini must figure on what has come to be known as a living wage for all the workmen; and the standard of living has considerably risen since the days of old Rome.

The trouble of finding a site in the center of the city without demolishing St. Peter's, or the Vatican, or the Castle of St. Angelo, or some of the other historic structures, is a formidable one, for it must be remembered that Mussolini has no desire to have such an architectural record-beater relegated to some vacant lot in the outskirts.

This building contains (on paper) 4,500 rooms, 100 large assembly halls, a theater, a gymnasium for the training of Olympic athletes, and a huge concert hall. The dictator proposes to call it the "Lictoria" as a memorial of the Fascist regime. It is designed to be a sort of Coliseum, Circus Maximus, Baths of Diocletian, and super-Capitol, all rolled into one. But Mussolini would do well to remember the Tower of Babel and the fate that overtook its ambitious projectors.

The Metamorphosis of an Ancient City

By KATHLEEN READ COONTZ

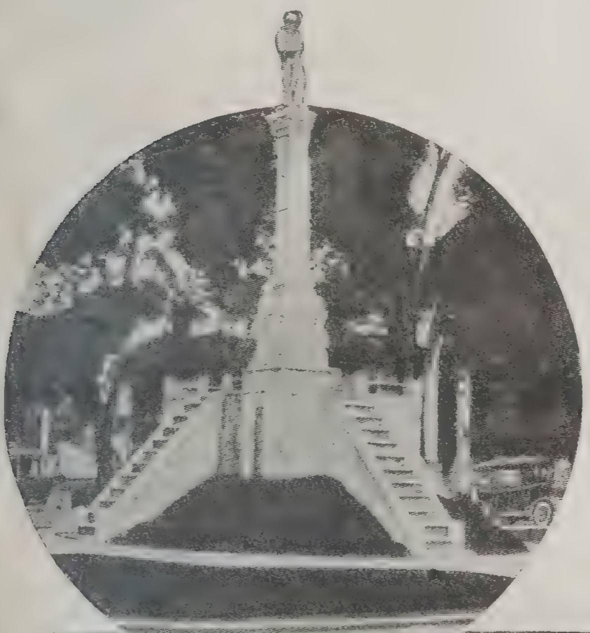


State Capitol of Louisiana.

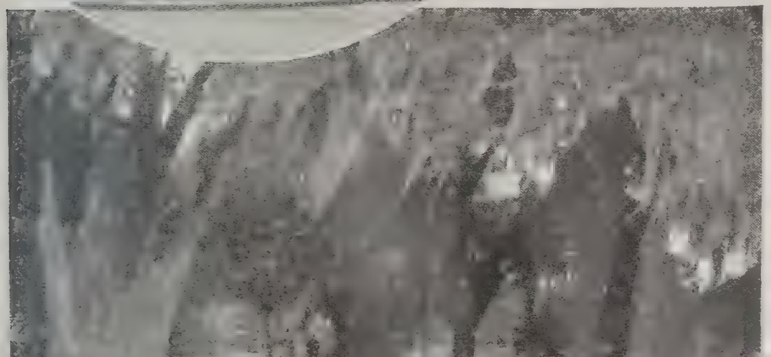
TWELVE years is but a dot in the history of any established city, and to the ancient capital of the State of Louisiana the period of twelve years in an earlier stage of her existence would have marked little change, but 1911 registered an epoch which was not only to double the population of the town of Baton Rouge, but so to change the features that one returning to a childhood home could scarcely find the century-old landmarks.

Twelve years ago the writer left this city of "Poetry in the State of Romance," high on the banks of the Mississippi, dreaming away in her sunshine, her flowers and her moss. One had the feeling that because Baton Rouge had held this unhurried charm for almost a century and a half that she possessed some magic that would hide her from the onslaught of the typical American city, and that wherever one might wander she would never cease to be as memory visioned her—quaint, drowsy, and redolent of that strange charm that had lured visitors from all quarters.

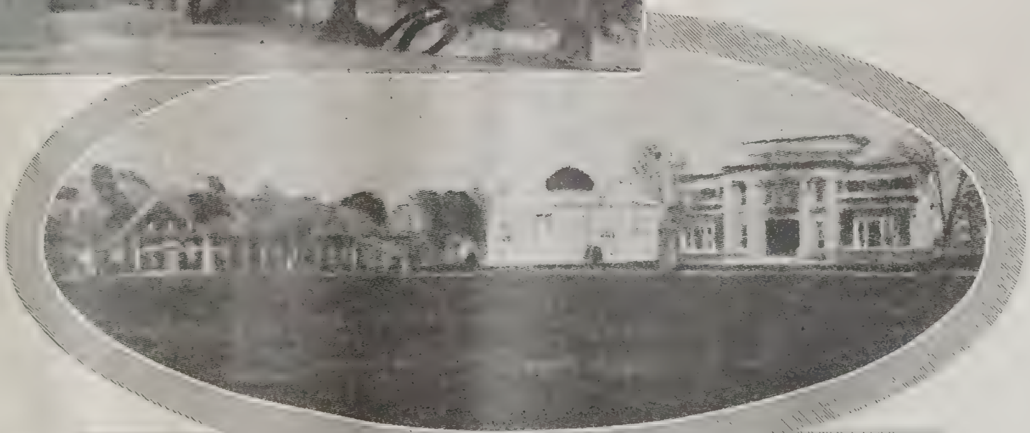
But the inevitable march of commerce and enterprise which seeks the most vulnerable spots for activity and expansion has not spared the brush of modernity on the quaint old capital of the state. The entire aspect of the ancient town has undergone a change, which, although it brings satisfaction to the heart of the industrial promotor, has nevertheless disturbed the poetical soul of Louisiana.



Above—Confederate Monument.



Below—By the bayou.



Louisiana State University Campus.

Dormitory and Agricultural Hall, Louisiana State University, Baton Rouge, Louisiana.

As a feeble answer to this spirit of the times, let us turn back the pages of Louisiana history and tenderly gaze on the former bewitching likeness of Baton Rouge.

Baton Rouge was settled by the French about 1718. Opinion is divided as to the origin of the name, which is the French for Red Stick. One historian has it that the French coming up the river discovered a pole bearing a bloody head, placed there by the Indians on the prominence which was the location of the settlement.

Another and more poetic version of the name, and one which is the favorite of all native Louisianians, is the story of how the tall red trunks of the cypress trees which were seen afar off by the French sailing up the river were mistaken for poles of blood, and were thus exclaimed over as "Baton Rouge."

However, the name clung to the settlement and a unique history distinguished the little town that began to grow, for it has had the honor, enjoyed perhaps by no other city of the United States, of having served under six flags, the most characteristic of which was that of the Republic of Baton Rouge.

As part of the Florida parishes the history of this city follows a somewhat different course from that of the rest of the Louisiana Purchase. It was not included in the purchase made by Jefferson in 1803, and before this had a stormy career in which it set itself up as a separate republic with a flag distinct from all the rest of the world.

The town became a British possession in 1763 as part of West Florida, and fell under the Spanish Government in 1779.

From 1849 to 1862 it was the state capital, when Shreveport was chosen for the Confederate seat of government, but in 1864 the Unionists made New Orleans the capital. The Louisiana Ordinance of Secession was adopted in Baton Rouge in 1861, and the city was the scene of much fighting during the Civil War, and was captured and held by the Union forces until the end of the campaign, when it was again made the capital of Louisiana, an honor it has retained.

Thus Baton Rouge has struggled for two hundred years, during which time the flags of France, Spain, Baton Rouge Republic, Britain, the Confederate flag and the Stars and Stripes of the United States have waved from her ramparts.

This is her history, as told in unadorned facts, but the romance, the seductive beauty, and absorbing interest of Baton Rouge is only known to those who have walked the cobblestone pavements, and dreamed under the ancient moss-draped oaks ringing with the fantastic music of the mocking birds, or stood by the orange trees, the fragrance of the waxen petals filling the soul, or sat at the feet of an old-timer and heard stories handed down from generations now dust in the placid, old Magnolia Cemetery.

A separation between this old burying ground and the adjoining National Cemetery, with its rows of white, unnamed stones and mounted cannon balls, does not loom so great today—Flanders Field has forever erased a boundary line of North and South—but time was when this seemed an alien plot to the little southern town, which each year decorated the graves of the boys in gray who lay sleeping in home soil. The soldier monument on the Square, raised in proud and undying loyalty to the southern lad, which so short a time ago towered above the quiet gardens nestled around, today appears squat and gray between tall office buildings.

The State University crowning the point overlooking the river and noticed by the visitor through the quaint architecture of the buildings on the Pentagon, has a past extending to the days of Spanish occupation when these buildings were occupied by the garrison and when the moss-covered armory contained implements of war which put to rout the poor natives. The haunts of those Indians today are marred by the many mounds, and children of the new civilization continue to find arrowheads and other ancient relics.

Roam over the grounds where the ancient gray buildings frown upon massive modern structures and one will come across a little stone that bears this inscription: "Loose the latchet from thy shoe for the ground thou treadest on is holy ground." If one has been fortunate enough to have heard a grandmother tell of the long ago, as has the writer, the sight of the shoe buckle, which Zachary Taylor wore when he lived on this spot, would bring a thrill, as would the stories related of that gallant gentleman.

The old lady's cheeks never failed to glow when she spoke of the wonderful night "When I danced with General Taylor, and when the ladies all surrounded him, he threw up his hands and exclaimed, 'General Taylor surrenders.'"

Today, with plans to remove the State University to a point farther down the river where the agricultural department may have room to expand, the question is being asked, "What will become of the old Spanish fort?" It is to be hoped that Baton Rouge citizens will not be too occupied with the progressiveness so recently acquired that they will neglect the opportunity to preserve for future generations this mute witness of an individuality that is fast disappearing.

The statehouse today stands unchanged, unique among the capitols of the United States. Presenting the appearance of an old Spanish palace from whose towers waves the American flag, it stands high on a terrace overlooking the Father of Waters, with the white petals of the magnolia dropping sôftly around its battle-scarred façades.

But it is on Lafayette street that the vandal seems to have been at work most ardently, in the past twelve years since commercial interests discovered Baton Rouge and that dear narrow old street which so proudly numbered among its houses the one that sheltered the great general, and which today is only a memory.

The old cotton gin in the east part of the town where happy-hearted Negroes toiled, crooning their weird chants, has given way to a modern factory; the little cabins on the bayou, where the last remnant of the Negro of the old South caught the crawfish for the gumbo, have been supplanted by stucco dwellings, and the bayou itself, its vagaries checked and no longer allowed to flirt with the river, presents itself as University Lake, and is a pretty setting for the groups of students in canoe and on shore who come from all parts, drawn by the magic spell of Louisiana.

Occasionally some landmark will loom up, tenaciously holding its own, in spite of the boarding house invading the town. One of these is the old Dougherty homestead, which served as a hospital during the Civil War, and where splendid southern women nursed Union and Confederate soldier alike. Behind its quiet garden it stands, its wide galleries extending on every side, its broad halls filled with that hushed air which tells of glories fled. This, the capitol, and the old Spanish fort are the three sturdy links which the present retains to connect Baton Rouge with its proud history of the past.

As the train moves out, a large sign, "Baton Rouge, A Good Place To Live In" greets the eye, glaring against a background of smoke and tall chimney stacks.

The writer will confess to closing lids over eyes suspiciously damp, while Memory, that witch Memory, soothed her heart by rearranging the scene in all its former loveliness. A whiff of jasmine was wafted from some neglected garden on the outskirts of the town upon which the dusk was fast descending.

Province of Ontario May Abandon Prohibition

If So, the Bootlegger Will Be Put Out of Business, But Not the Rum-Runner

By FREDERIC T. YEALLAND

TO THE people of the United States the result of the pending vote in Ontario, Canada, on the question of prohibition is of no small consequence. On it depends whether the oasis in the great North American desert shall be still further extended, whether the Republic shall have a liquor-drinking neighbor along its entire northern boundary, reaching from the Atlantic to the Pacific, or whether there shall continue to be one dry spot extending north of the international boundary from the Detroit to the Ottawa rivers. If Ontario votes "wet" officers intrusted with the enforcement of the United States "dry" laws may find it more difficult than ever to carry out their already arduous duties.

Of special interest to the American people, particularly those of the border states, is the question: If Ontario votes wet, what effect will repeal of the Ontario Temperance Act have on the rum-running activities between the two countries? The answer to this depends to a considerable extent on the nature of the legislation substituted for the existing law. It would be only natural that the rum-runner would cling to his highly profitable business as long as he could. The manufacture of whisky and beer for export would continue under any law the province might pass, and it would be from the distilleries and breweries, under a government control law, that the government stores would be stocked. It is as "exporter" that the rum-runner obtains his supplies other than "moonshine," and the provincial authority might be able to check his activities to some extent by including in any new legislation provisions which would make it costly for him if "caught with the goods." Only federal enactment, however, can be expected effectually to cope with the rum-runner, and as with a wet Ontario thirsty ones would have no further use for him the government at Ottawa would have no cause to fear public hostility if it legislated to put him out of business.

Effect on the Border Cities

THUS far Quebec province's abandonment of prohibition has tended to increase rather than check rum-running as reports from the eastern parts of both countries from time to time clearly show. The West is too newly back into the liquor business to be able to determine whether the illegal international traffic out there has been lessened, the votes in two of the provinces, Alberta and Saskatchewan, not having yet been put into effect. So far as Manitoba and British Columbia are concerned the illegal traffic still goes on. Under the circumstances, no matter what the result of the vote in Ontario may be it is not asking too much that the Dominion government, if only as an act of neighborly courtesy, pass a law putting down rum-running. The people of each country have a right to prohibit the liquor traffic within its own borders—no one disputes that—and it ill becomes a country professing friendship to permit its citizens to set a law of a neighboring nation at defiance As it is, even while Ontario's decision is yet to be made, there are thousands of miles of international boundary over which liquor is being taken from Canada into a country which prohibits, and it is reasonable to hope that Canadian public opinion will force the federal government to proper action and thus give to over-sea countries, through whose indifference and inaction the disgraceful "rum row" off the American Atlantic Coast is made possible, a lesson in international courtesy. Such a law would have the effect of checking a new-rich class, a Canadian aristocracy in the making from whom is collected annually tens of thousands of dollars in federal income tax, thus giving official approval of a traffic that is a disgrace to the Dominion and tends to debauch the people of a neighboring country. Whatever the result of the vote in Ontario, on October 23, may be, whether it be in favor of giving the Ontario Temperance Act further trial or the repeal of that measure, the plain duty of the federal government is to do its part toward freeing itself of the scandal of the rum-runner, of permitting its citizens systematically to assist those of a friendly nation in setting at defiance an established law of that nation. Otherwise there is certain to be a spread of international lawlessness along a border thousands of miles in length detrimental to the best interests of both countries.

As far as bootlegging is concerned, both it and the blind pig will in all probability be put out of business if Ontario votes wet, for nobody will have use for either if the beer and liquor to which they once were accustomed can be obtained without police interference and without running the risk of drinking poisonous moonshine.

But *will* Ontario vote wet? *Will* the rich and great province go back to conditions such as existed before war came to the world?

A stranger in the province mixing among its people and listening to their expressions of opinion cannot but come to an affirmative conclusion. Popular opinion seems to be based on the votes in the four western provinces, all of which are now in the wet column. The feeling is abroad, apparently, that Ontario cannot afford to be the only Canadian province west of the Maritimes under prohibition. Moreover, the immense American summer tourist traffic in Quebec province is looked upon with envious eyes by the sordid-minded, who believe that with prohibition gone Ontario would get a far larger share of this traffic, which means millions of dollars annually to store and hotel keepers and others of Canada. Then, too, the trade of the thirsty of United States cities bordering on Canada would certainly mean the spending of much United States money on the Canadian side. For whatever system of government sale supersedes the Ontario Temperance Act in the event of the defeat of that measure it will be open to visitors from other countries as well as Canadians. The result will be that Windsor, Sarnia and Niagara Falls, Ontario, will have a new interest to the thirsty of Detroit, Port Huron, Buffalo and the nearby communities of each of those cities, who may be expected to bring home that which is so difficult to procure, if not in flat bottles tucked away in hip and inside breast pockets, certainly on their breath. This would mean still further trouble for prohibition enforcement officers on the south side of the border.

Prohibition workers, when asked, take an optimistic view of the outlook. They cannot, they declare, believe that the premier province of the Dominion will join with its sister provinces in undoing what took so many years to accomplish. Ontario is the best-behaved of provinces, they boast, is a leader rather than a follower, and can be relied on to stand firmly by a legislative enactment, more than once endorsed by the electorate, and which has been of such great benefit to the people. Dry leaders, moreover, have the utmost faith in the women voters, the chief beneficiaries of prohibition, and argue that it is impossible to turn the tremendous dry majorities given in previous votes into a dry minority. Of the five votes taken on the liquor question in Ontario since 1894 every one has been most emphatically in favor of prohibition, the majority in the most recent referendum in 1919 being 407,289 in favor of retention of the Ontario Temperance Act. In the turnover in the western provinces, prohibitionists see the fine hand of the voter from European countries, where people are not so well educated on this question as are the native Canadians.

On their part opponents of prohibition, as represented by the Moderation League, appear to be quite satisfied as to the prospects. It is their claim that as prohibition was an outgrowth of war people have come to the belief that peace-time readjustment cannot be effected until the country gets back to peace-time conditions, or near them, and that those conditions cannot be reached so long as any of the provinces are under prohibition. A great revulsion of popular sentiment has set in, they argue—a revulsion such as is seen in all countries where a once-popular government, backed by a large majority in parliament, is hurled from office by a dissatisfied electorate on the first opportunity. This revulsion first manifested itself in Quebec province, next in British Columbia, then in Manitoba and finally Alberta and Saskatchewan in that order until today (leaving the Maritime Provinces out of consideration), there remains only Ontario to mar a wholly wet Canada, and Ontario, they further claim, is going to complete the job on October 23. The fact that Saskatchewan, which voted dry a few years ago by a tremendous affirmative vote, recently went wet by a majority of 38,956, in the opinion of the antis, only shows there is little in these votes to encourage Ontario prohibitionists. The further claim is made by the wets that thousands of voters who indorsed prohibition as a war measure have sickened of it as it has operated in time of peace.

That the sympathies of the Ontario government, or a majority of the cabinet ministers at least, are with the opponents of prohibition is a claim of the drys. Hon. W. E. Raney, who, while Attorney-General in the late Farmer-Labor government, had to do with the administration of the Ontario Temperance Act, in an open letter recently charged the present holder of the office, Hon. W. F. Nickle, with grave laxity in the inforcement of that law with the object of bringing it into contempt. Mr. Nickle, it is only fair to say, vigorously denies this, but it is an undeniable fact that in recent months it has been no difficult matter to obtain beer or liquor in Toronto hotels, and similar stories are told of Windsor. This has been particularly noticeable during the holding of conventions in those and other cities, and it is no secret that at picnics at popular resorts beer has been openly drunk and no one has been prosecuted. There may be no truth in Mr. Raney's charge against Mr. Nickle, but there is too much evidence of laxity somewhere.

Government Sympathy With "Wets"

GOVERNMENT sympathy is also alleged in the premier's withholding of public announcement of its decision to take a plebiscite and his still further delay in giving to the public the form of ballot to be used. While the general public was kept in ignorance on these points for months, the Moderation League, it is alleged, was in the government's confidence, and it is claimed that the anti-prohibition cause is no mean gainer as a result.

The decision as to the form of question to be answered in the coming plebiscite was not given out until about two months after the date of voting was made public, and it is common talk that men prominent in the Moderation League had something to do with the forming of the questions. However that may be it is certain that on the day the long-looked-for announcement was made the government went through the form of calling leading men of both sides into conference.

The questions to be answered are:

1. Are you in favor of the continuance of the Ontario Temperance Act?

2. Are you in favor of sale as a beverage of beer and spirituous liquor in sealed packages under government control?

It is to question No. 1 that dry leaders offer chief objection. They would have preferred the straight question, "Are you in favor of prohibition?" The fear is that prohibitionists who are not satisfied with the Ontario Temperance Act as it is—and there are no doubt many of them—may be induced to vote "No" to the first question, while if they were required to say whether or not they favor prohibition they would unhesitatingly answer "Yes." As the vote will be a plebiscite, all that is really necessary, drys claim, is the one question as to prohibition. If the second question is affirmatively answered, it is pointed out, the government will be able to claim authority to give the public the "hardest" whisky, as well as beer and wine.

On the other hand, Premier Ferguson explains that "government control," in the view of the government, does not mean a system of sale as in operation in Quebec and British Columbia, but that the government will make all sales and that the people will be given opportunity as expressed by their votes at the polls in purchasing beer and liquors under strict regulations.

The object of the anti-prohibition leaders evidently is to get the liquor question back into politics, experience having encouraged their belief that once it is there again they need have no further fear of the enactment of another such law as the Ontario Temperance Act. But the old "liquor interest" as it was before the war has disappeared, and without the licensed bar as it was in former days, which few care to assert will ever come back, that interest is certain to remain away. The only real liquor interest today is that composed of the brewers and distillers, with the Moderationists thrown in. The two first named are influenced solely for gain, which the abandonment of prohibition would return to them in large measure; the other by a strong objection to any interference with what they shall eat or drink, or, as they express it, their "liberty." But the brewers, distillers and Moderationists all together could never form a combination so influential in politics as existed when the licensed hotel keepers were a big factor in elections. With the latter out of the reckoning it is difficult to see how either political party is to be forced to commit itself to liquor license as a policy.

Stubborn Struggle Impending

NEVERTHELESS experience of the last two provincial elections has taught that the anti-prohibition vote—solid, though without organization—is a power in provincial political affairs. First it punished the Conservative party by assisting, in 1919, in the overthrow of the government that introduced the Ontario Temperance Act, and in the election of 1923, influenced by the belief that after all more in the way of liquor was to be expected from a Conservative government than from any other, threw its weight with that party and helped bring it back to office. No one realizes more fully than the present government the true strength of the anti-prohibition vote in Ontario, but even that knowledge is hardly likely to be sufficient to induce that government or any other to make "return of the bar" a plank in its platform. For years before the war the hotel keeper's political ardor was prompted by the most selfish object. From time to time municipalities would vote on the question of license reduction, and almost invariably the verdict would be favorable, the result being that in one city the number of licenses was eventually reduced from more than one hundred to between twenty and thirty, while other cities told a similar story. The hotel man realized that only by the best of election service to the government of the day could he hope to retain his license and remain in business; hence his ardor during election campaigns. It was fear of offending the liquor men, who had helped keep one party in power in the province for upward of thirty years, that prevented the carrying out of the popular demand for prohibition as expressed in the plebiscite of 1894.

In the coming contest, therefore, it will be pretty safe to omit the old liquor interest from the reckoning, leaving the struggle between those whose cellars are going dry, with those who couldn't afford to put by for a dry day, and those who rejoice in the fact that within the last few years tens of thousands have grown from boyhood to man's estate in a barless Ontario and are prepared to strain every effort to the end that other generations shall grow up under like conditions. Not even the bitterest opponent of prohibition, however he may wish to the contrary, sees any hope of the bar coming back.

A wet majority on October 23 will mean the undoing of all that has been achieved by the prohibition forces of Ontario after decades of strenuous effort. It would mean conditions in Canada's premier province similar to those which have existed in Quebec since the close of the war, the putting of alcoholic beverages within the reach of old and young. Such a state of affairs would, of course, be highly discouraging to prohibitionists; but it would do this much good—it would teach them the lesson that instead of devoting their energies to obtaining temporary prohibition in province by province they should aspire to something of a permanent character—a law after the pattern of the Volstead Act, which applies to the whole country. It may be that a stubborn opponent would be found in an unsympathetic senate, which has to pass on all legislation coming from the popular house of parliament; but it may be that, after another taste of a legalized liquor traffic, public feeling will become so aroused that the irresponsible upper house would think twice before resorting to obstructive tactics. Dry leaders cannot be blind to the fact that making Canada dry by installments is uphill and unsatisfactory work, that there is no knowing how long a province which gets into the dry column will remain there, and it seems only reasonable that they change their policy and reach out for something more enduring and more far-reaching. It will be a tremendous job, take years to bring it to fruition, but the end sought would be well worth every effort. If prohibition fails in the coming plebiscite its advocates may be expected to make a fresh start in a work involving, first of all the education of government and parliament.

Meantime, both sides are preparing for a stubborn struggle. Since the nature of the questions to be answered on the ballot has been made known, each party has given evidence of a determination to win.

The Floating Mansion of the Presi

Combines Sumptuousness With Comforts of His New England Hom

By S. R. WINTERS

REPORTS appearing at frequent intervals in the newspapers that President Coolidge and family are entertaining a group of friends on the *Mayflower* convey little real information, with the exception that the public is informed of the movements of the Chief Executive. The kind of vessel in which the President is carried on these short cruises down the Potomac River, the environments surrounding the Presidential party on these week-end excursions, and the subjects that engage the attention of the titular head of our government while aboard the *Mayflower*, are the things that stimulate the popular imagination.

This patrol yacht, reserved for the exclusive use of the Chief Executive of the Nation, is in a measure a mansion afloat. The comforts and conveniences of the White House are to be found on this time-honored craft, with the added pleasures attendant upon cruising through the water. A spacious dining room, sleeping quarters for the President and his wife and as many as fourteen guests, reception room, smoking room, library, and a motion-picture theater on deck, are among the facilities at the command of the President and his family when they sail the Potomac River. The boat itself, rich in appointments, has a valuation approximating $1,500,000.

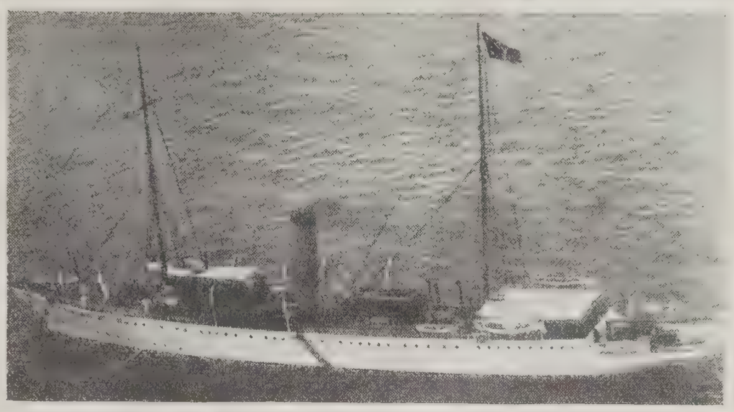
The observances and customs on this handsome yacht vary, of course, with the different Chief Executives at whose commands it is placed. For instance, President Coolidge has introduced the departure of having religious exercises conducted on board the *Mayflower* during Sunday cruises. In keeping with this evidence of spiritual devotion, a chaplain of the United States Navy is included among the personnel of this patrol yacht, just as a chaplain is present on a man-of-war. This permits President and Mrs. Coolidge to attend religious services on board a vessel with quite the regularity with which they are accustomed to visit a Washington church when occupying the White House over Sunday.

The entertainment facilities on board the *Mayflower* include the United States Navy band, a radio receiving set, a motion-picture outfit, a piano, and a victrola. Motion pictures, for instance, are exhibited on the fantail of the vessel. The Presidential party, together with the officers and enlisted personnel of the U. S. S. *Mayflower*, assemble on the main deck to witness the pictures shown on the screen. The President of the United States and the sailor, who may be assigned the humble task of scrubbing the deck of this graceful yacht, meet on a common ground to view these cinema productions. The officers cite this an instance of the informality that characterizes the attitude of President and Mrs. Coolidge when on board their private yacht. Of course, they receive honors and courtesies that are justly theirs, but such endowments are shared with "common sense," which phrase has become a campaign slogan with the Coolidge Administration.

As the writer visited the various compartments on the *Mayflower* he was impressed with the homelike atmosphere with which the officers sought to surround the Chief Executive. True, the appointments are palatial in appearance but many of the things that you would find in a New England home are faithfully preserved in this floating mansion. Of course, the rooms are heated by steam, and naturally you would not expect to find an old-fashioned fireplace. The latter is provided, artificially, by means of that obedient servant, electricity. This make-believe fireplace involves the placing of two electric light bulbs in the midst of red bunting, which in turn is shielded from the heat, and then they are surrounded by blocks of crystals. When the electric current is turned on, the old-fashioned fireplace is simulated so that the eye is not likely to detect the deception.

The dining room on the *Mayflower* is decidedly pleasing to the eye, and judging by the predominant color tone it may be described as the "Blue Room." The "Harding Blue" not only prevails since the death of former President Harding and the retirement of Mrs. Harding to her Ohio home, but Mrs. Coolidge has contributed to the prevalence of this color. She has placed several blue vases and candlesticks in the dining room. The soft atmosphere which these blue furnishings afford is inviting to the most critical eye. A table occupies the center of this room and when this is extended a group of twenty-four persons may be seated comfortably for dinner or other meal-time engagement. There is a cook on board this vessel whose duties are devoted to the preparation of meals for the Presidential party.

The President and his wife each have separate bedrooms. All told, there are seven bedrooms for guests on the *Mayflower*, affording sleeping quarters for fourteen visitors. A bathroom is accessible for occupants of each of these guest rooms; and, oddly enough, there are two solid metal bathtubs adjoining these rooms. However, they constitute original fittings of this yacht and were not installed because of any special latter-day requirements. One guest room, although equipped with two beds and other furnishings in common with the six other bedrooms for guests, is distinctive by reason of a metal plate tacked on the footboards of each bed. The inscription on each of these plates reads as follows: "From the U. S. S. *George Washington* and the suite occupied in 1918-1919 by President and Mrs. Wilson on their trips to and from the Peace Conference at Paris. The same suite was occupied by the King and Queen of the Belgians on their visit to the United States."



"Official photograph United States Navy."
The *Mayflower* with steam up ready for a cruise on the Potomac.

That the comfort of the Chief Executive of the Nation is sought after to the fullest extent while he is aboard this patrol yacht is attested by an incident occurring during the administration of President Woodrow Wilson. When the latter was stricken with illness after the Peace Conference in Paris, an elevator was installed on the *Mayflower* that he might go from deck to deck with the minimum physical exertion. This elevator was never used and has been removed altogether. Another incident which has gained currency, but which is not verified by the United States Navy Department, is that during the illness of President Wilson, Thomas R. Marshall, then Vice-President, accompanied the King and Queen of the Belgians to Mount Vernon under a special flag flown from the President's yacht. The Bureau of Repair and Construction of the Navy Department doubts the authenticity of this reported incident, stating that the Vice-President has no flag and that naval regulations would not permit the making of such a flag.

The reception room on the *Mayflower* is provided with a victrola, a piano, and a loud-speaking device. The latter is connected by wire with the radio shack or room on the upper deck and entertainment by radio is thus furnished the Chief Executive and his guests. President Coolidge, for instance, listened t proceedings of the conventions of the two major litical parties when cruising during these sessions. library is on board, the books consisting of discussio of constitutional law and military and naval histories a home and abroad. If, however, the President desires to read a special book he brings such published volume on board the ship, since this small library contains only a few standard books.

A ward room is reserved for the officers of the *Mayflower*, hanging on the walls of which are portraits and autographed signatures of the five Presidents who have had the privileges of a private yacht—Theodore Roosevelt, William Howard Taft, Woodrow Wilson, Warren G. Harding and Calvin Coolidge.

Captain Adolphus Andrews is the commanding officer of the *Mayflower*, and Lieutenant Commander John F. Meigs is ranking commanding officer. These officers and other members of the staff occupy the singular position of being aides to the President and yet they are subject to the regulations of the Navy Department.

The courtesies and pleasantries exchanged between the officers of this vessel and naval representatives of other countries is one of the many fine things to the credit of the executive staff of the *Mayflower*. A token appreciation of this friendly relation was expressed by the Russian delegates to the Conference for the Limitation of Armaments in the presentation of a solid silver punch bowl to the officers of the *Mayflower*. This bowl is one and one-half feet in diameter and one foot deep, with the emblem of a knight in full armor standing alongside the bowl. The knight is studded with semi-precious stones, some of which have fallen out but are now being replaced. The inscription of esteem is carved in the Russian language.

The U. S. S. *Mayflower* is rich in historic lore. Built by a British firm, J. & G. Thompson, of Clydebank, Scotland, she was purchased by the United States Navy Department on March 19, 1898, at a stipulated price of $430,000. She was designed by George L. Watson, who also designed the *Thistle*, competitor for the American yacht racing cup in 1887, but she was defeated by an American yacht *Volunteer*. The *Mayflower* was purchased from the estate of Ogden Goelet, who died aboard the vessel on his first cruise. Before being set aside for the exclusive use of our Presidents, the *Mayflower* had a varied service. She served in the blockade off Havana in 1898, during the Spanish-American War, and in 1900 was detailed for special service in offering succor to destitute Americans in San Juan, Porto Rico, sufferers of a typhoon. For two years she cruised the Porto Rican waters, when during the latter part of 1902 she was designated as the flagship of Admiral Dewey. At intervals during her twenty-six years of service in this country she was placed out of commission only soon to be restored to active duty.

The U. S. S. *Mayflower* was converted into a Presidential yacht in 1905, since which time she has served in the exclusive capacity of being at the beck and call of our Chief Executives. For instance, it is recorded that President Roosevelt exercised unusual strategy on the *Mayflower*, then anchored in

Farmer's Calendar.

Let your firſt buſineſs be this month, after your yards are cleared of ſummer manure, to repleniſh them with new materials from meadows, pond-holes, drains, &c. This particular I have repeatedly and earneſtly urged, and am now almoſt ready to flatter myſelf that it has had ſome ſmall influence, as I have the pleaſure to obſerve that almoſt every farmer in my vicinity appears emulous in increaſing this valuable treaſure.

Every wiſe huſbandman will now make proviſion for the ſecurity of his fields, by digging and heaping up ſtones for walls, to be removed the firſt ſledding.

Houſe your farming utenſils.

It will now be the buſineſs of every prudent man to put his houſe and barn in a poſture of defence againſt the winter, by banking his houſe, putting panes of glaſs in his windows, boards on his barn, &c.

Commence threſhing as ſoon as your out-door arrangements are made for winter.

Early-made cyder ſhould be now racked off: be careful to put it into clean caſks.

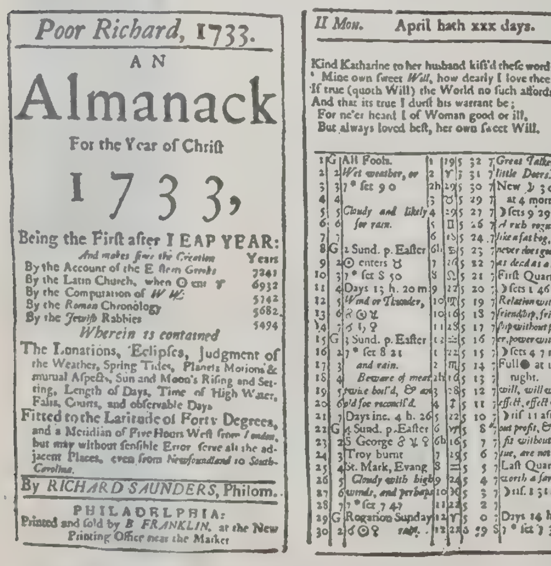
Fatting ſwine that do not feed well, give a doſe of brimſtone or antimony, and it will have the deſired effect.

Farmer's Almanack for 1800 by Robt. B. Thomas. Note that November began on Saturday as it does this year.

THE most popular and at the same time most widely read book in all the world is the humble almanac. No family is too poor to have the book, because Lydia E. Pinkham furnishes free copies. In colonial America every farmer had the almanac hanging by the fireplace, convenient to consult by the light of the fire.

In Europe and in America almanacs were among the first printed books. Long before the invention of printing, scribes made up the calendar in almanac form with a list of the holydays and with the position of the planets. In this way the demands of science (astrology) and religion were both satisfied. It is worthy of note that in Europe a child is named commonly after that saint upon whose day the child's birth occurs. In any event, the pious son or daughter of the church celebrates not the birthday but the "name-day" or day in the calendar corresponding to the given name. One would be unlucky to be born on January 20, for example, for that is the day of Saints Fabianus and Senus and one might be named Sebastian or Fabian. one in the northern hemisphere can study the calendar without noticing that winter comes in December and spring in April. From such simple beginnings it was easy to try to calculate the weather more in detail in advance. Certain seasons seem to bring rheumatism and other ailments. It was not unnatural to connect these ailments with the weather and with the stars. What more natural to suppose than that these heavenly bodies control human destiny and this reasoning once begun even the toothache was likely to be blamed to some unfortunate star.

The Early English almanacs listed the "dayes good to sett and sowe, to take medicines, to lett bloude, to cut heares and fortunate and unfortunate dayes," together with "the daily disposition of the weather, with the juste (exact) hower and minute of the chaunge." Eclipses were great favorites in the almanacs. Under March 3, 1569, one Joachim Hubrighe, "Doctour of Physicke and Astronomie" set down: "Eclipse of the Moone, which bringeth with it verie pestiferous fevers, and other diseases, whyche the Lorde dothe sende among us onely for synne, except we speedyly repente."



Poor Richard, 1733.

II Mon. April hath xxx days.

Kind Katharine to her husband kiſs'd theſe words,
'Mine own ſweet *Will*, how dearly I love thee!'
If true (quoth Will) the World no ſuch affords.
And that its true I durſt his warrant be;
For ne'er heard I of Woman good or ill,
But always loved beſt, her own ſweet Will.

Title-page Poor Richard's Almanack, 1733. If you can find a nice copy of this Almanack of 1733 (in your attic) it would be worth a thousand dollars. Benjamin Franklin was the author and printer.

The whole circuit of the heavens is divided into twelve parts of 30° each, making the twelve signs of the zodiac. In addition, each wandering star or planet had its symbol and these combined with the others give a mystic effect to the calendar.

Symbols

Later each sign of the zodiac was associated with some part of the human body. This is the fearful figure of a man which ornaments, so to speak, the front page of many a modern patent medicine almanac. Richord Allestree in 1625 wrote as follows: "When you would purge any part of man's body, let not the Planet which is significator of the part of the strong or fortunate in the Heaven (if you can tell when it is). For example, purge not the gall, Mars being fortified. You shall have the parts of man's body, which the Planets are attributed unto set downe for your better knowledge in the fifth page within my almanacke. Stop humours, fluxes or rheumes, the Moone in Tauro, Virgine or Capricorno. Observe that medicines are better to be given in the decrease or wane of the Moone than in her increase or spring . . . .

"An unguent or plaister is best applied when the Moone is in the imaginary signe attributed to the member whereunto it is applyed. But above all remember where the Physitian is not paid the disease goeth backward."

Aside from a single page published in 1739 the first American book was "An Almanack, calculated for New England by Mr. Pierce, Mariner." The printer was Stephen Daye, of Boston. No copy is preserved. The earliest American almanac that has survived the ravages of time is one of 1646 by Samuel Danforth, preserved in the Massachusetts Historical Society.

In 1692 the "Boston Almanack" introduced into America the rubricated calendar, with the title-page in red and black and "red-letter days" are known from this use of red ink.

German almanacs and calendars were long popular in Pennsylvania and are found there even today; their appearance here began with "Der Teutsche Pilgrim Auf das Jahr 1731."

The first "Farmers' Almanac" appeared at Boston for 1713. In 1793, Robert B. Thomas began "The Farmer's Almanack" which continues under the same name even to the present year, now with the title, "The Old Farmer's Almanac." It probably does not have a large circulation as it is not free.

The "Ladies' Diary" with mathematical questions was an English venture of 1704 which became more popular with the introduction of recipes for cooking and preserving instead of arithmetic. In 1741 the "Gentleman's Diary" made its appearance and 100 years later the two, having arrived at the age of discretion, were married by the proprietors and this "Gentleman's and Ladies' Diary" for 1924 can be bought in England.

The humorous almanac began with "An Almanack after a New Fashion, 1664," written by Poor Robin, "Knight of the Burnt Island, a well-wisher to the Mathematicks," which ridiculed the astrologers and stargazers. This name accounts for the use of "Poor Richard" in the most famous of all almanacs, that by Benjamin Franklin, first published in 1733.

Maxims and poetry for each month, with scattered sage observations, made the sayings of Poor Richard household words.

Maxims—"Poor Richard," 1733.

The favour of the great is no inheritance.

Beware of the young doctor and the old barber.

Eat to live, and not live to eat.

To lengthen thy life, lessen thy meals.

The proof of gold is fire; the proof of woman, gold; the proof of man, a woman.

Men and melons are hard to know.

Maxims—1734.

Better slip with foot than tongue.

Teach your child to hold his tongue, he'll learn fast enough to speak.

An egg today is better than a hen tomorrow.

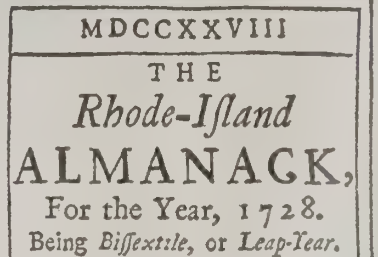
Poetry for May, 1734.

"Wedlock, as old men note, hath likened been,
Unto a public crowd or common rout;
Where those that are without would fain get in,
And those that are within, would fain get out."

Maxims

Early to bed and early to rise,
Makes a man healthy, wealthy, and wise.

Creditors are a superstitious sect,
Great observers of set days and times.



MDCCXXVIII
THE
Rhode-Iſland
ALMANACK,

A pocket Almanack for the year 1754. "Fitted for use of Pennsylvania and neighboring provinces. Printed by B. Franklin."

Benjamin Franklin published his almanac under the name of "Richard Saunders, Philomath," or lover of mathematics. Franklin spoke with justifiable pride concerning it: "I endeavored to make it both entertaining and useful; and it accordingly came to be in such demand, that I reaped considerable profit from it, vending annually near ten thousand. And observing that it was generally read, scarce any neighborhood in the province being without it, I considered it as a proper vehicle for conveying instruction among the common people, who bought scarcely any other books; I, therefore, filled all the little spaces that occurred between the remarkable days in the calendar with proverbial sentences, chiefly such as inculcated industry and frugality as the means of procuring wealth, and thereby securing virtue; it being more difficult for a man in want to act always honestly, as, to use here one of those proverbs, 'It is hard for an empty sack to stand upright.' These proverbs which contain the wisdom of many ages and nations, I assembled and formed into a connected discourse, prefixed to the almanac of 1757, as the harangue of a wise old man to the people attending an auction. The bringing all these scattered counsels thus into a focus enabled them to make greater impression. The piece, being universally approved, was copied in all the newspapers of the continent (that is, the American continent); reprinted in Britain on a broadside, to be stuck up in houses; two translations were made of it in French, and great numbers bought by the clergy and gentry, to distribute gratis among their poor parishioners and tenants. In Pennsylvania, as it discouraged useless expense in foreign superfluities, some thought it had its share of influence in producing that growing plenty of money which was observable for several years after its publication."

Franklin was particularly popular in France and the

First Iron Bridge Still Carries National Pike Traffic

THE first iron bridge built in America, the eighty-foot single arch across Dunlap's Creek in Brownsville, Pennsylvania, between Uniontown and Wheeling, still carries the traffic of the famous National Pike.

This historic structure was completed July 4, 1839, more than eighty-five years ago. During the palmy days of the old Cumberland Road, stagecoaches and Conestoga wagons passed over this bridge in a constant stream.

For more than half a century after the coming of the railroads, the National Pike, the first improved highway between the seaboard and interior, was little used except for local horse-drawn travel.

Now an endless procession of automobiles and motor trucks race across the Dunlap's Creek bridge at high speeds and carry greater loads than were dreamed of by its bold, able designer.

In addition, the staunch, well-proportioned structure is being subjected to a further dead load, not contemplated when it was built, consisting of two concrete sidewalks each about six feet wide, together with the beams and brackets supporting them without any reinforcement of the arches or the abutments.

Captain Richard Delafield, U. S. Army Engineer Corps, designed and erected this bridge. His principal assistant was Lieutenant G. W. Cass. The brilliant careers of these men explain the worth of the first iron bridge erected in the New World.

Captain Delafield later was twice superintendent of West Point; our observer at the siege of Sebastopol, and, finally, chief engineer of the U. S. Army and regent of the Smithsonian Institution.

Liutenant Cass entered civil life and helped organize the Adams Express Company, of which he became president. He was subsequently president of the Pittsburgh, Fort Wayne & Chicago Railroad, part of the Pennsylvania System, and lastly president of the Northern Pacific.

In a letter to General Charles Gratiot, chief engineer of the U. S. Army, dated March 21, 1836, Captain Delafield describes the plan of this bridge as "different in its principes of construction from any of which I could find a notice by either English or French engineers."

The eighty-foot arch of the Dunlap's Creek bridge is composed of five large, round, cast-iron ribs, termed voussoirs. Each voussoir is made of nine hollow pieces or segments. The five voussoirs parallel each other.

The arch rises eight feet from the points where the voussoirs spring from the abutments to the center of the bridge. The level roadway is built on top of this arched framework, the bones of the bridge.

The abutments are of sandstone masonry, each 25 feet wide, 14 feet thick and 42 feet high. They are faced with so-called springing plates of cast iron, each 28 feet 8 inches long and 2½ inches thick, upon which the ends of the 5 ribs of the arches rest.

The iron work in the bridge was constructed in the establishment now known as the Herbertson Foundry, in Brownsville. Doubtless it was the location of the foundry in Brownsville and the availability of Pittsburgh pig iron via the Monongahela River, which connects the two places, that emboldened the army engineers to embark upon the adventure of building this country's first iron bridge.

In the letter to General Gratiot, previously quoted, Captain Delafield also said that he had ordered Lieutenant Cass to go to the Pittsburgh furnaces and purchase the "pig metal of a quality similar to that used there for Gun Metal." One hundred and fifty-nine tons was used.

Captain Delafield rented the foundry and its staff stating, "By this course I can secure a choice of metal and can control the mode of casting in any way it may be found desirable." He took no chances upon inferior material or workmanship and time has proved his wisdom.

There are two hundred and fifty castings in the bridge as well as the wrought-iron railings. Although cast iron strongly resists rust, Captain Delafield took the precaution, after the superstructure had been erected, immediately to cover it with a coat of gas tar and then three coats of white lead paint.

The construction of the bridge was started late in 1836 and while it was so far advanced that its use commenced about July, 1838, its completion and formal opening did not take place until Independence Day, 1839. The cost was $39,901.63.

The Dunlap's Creek bridge was built as a part of the reconstruction of the National Pike undertaken by the Federal Government preparatory to turning it over to the respective states through which it passed.

George Washington personally located much of the route of the National Pike, first known as the Cumberland Road, across the mountains. However, it was not until 1818 that construction was undertaken in earnest. It was a project of the Federal Government and, with the possible exception of the famous Richardson Highway in Alaska, the only important roadbuilding of its kind. It is said to be the longest continuous paved road in the world.

The eighty-foot single arch across Dunlap's Creek, Brownsville, Pennsylvania.

Does Tobacco Injure Mental Efficiency?

Concluded from page 4

sidered a profit or a loss may be gleaned from the state legislation of Virginia, where we find that the articles prohibited to children include pistols, bowie knives, dirks and tobacco. The classification ought to be significant. A more striking fact is presented by the legislation that obtains in Washington. Here the sale of pistols and revolvers is prohibited to children under the age of sixteen, but tobacco under the age of twenty-one.

"Those who maintain that tobacco is a profit are asked to explain the legislation of the State of Maine, which puts tobacco in a class with poisons and narcotic drugs; and that of the State of West Virginia, which places tobacco in a class with opium."

Japan has a law prohibiting smoking by all persons under twenty years of age. There has been talk of national prohibition of tobacco in Sweden. England has just passed legislation prohibiting the sale of tobacco to all minors under the age of sixteen. The German Republic shows active interest against the further expansion of the tobacco habit. In some of the German cities, the boards of education have appointed teachers to lecture in the schools against the use of alcoholic liquors and tobacco.

Other Condemnation

Boys' schools in America have generally tried to prevent the use of tobacco, as have some colleges—notably Oberlin, the North Dakota Agricultural College and the Agricultural College of Utah. Certain colleges and academies have tabooed the use of tobacco among their faculty members. Among the heads of colleges who have taken a strong stand on this subject are the presidents of the University of Wisconsin, the University of Illinois, the University of Cincinnati, Lehigh University and Bowdoin College. The use of tobacco, although not entirely forbidden in our National Military and Naval academies at West Point and Annapolis, is nevertheless very largely restricted. Officers of McMinnville College, in Oregon, in 1917, placed a ban on the use of tobacco in all its forms. A number of big western newspapers commented favorably on the action.

The general policy of the Young Men's Christian Association throughout the country has been against tobacco, and I understand that few of its secretaries use it. The Boy Scouts make it one of their chief aims to fight the cigaret. The Salvation Army does not permit any of its officers to use tobacco in any form.

Summary

We find, then, that tobacco injures the mind as well as the body. It reduces mental efficiency and accuracy, and reduces the power and inclination to study. In short, it dulls the razor edge of the human mind, in all its functions, thinking, feeling and willing.

The most that can be said for tobacco is that it gives pleasure. This is true in the same sense that opium, or alcohol, or any other narcotic gives pleasure. But such pleasures are elusive; for they are short-lived and self-defeating. In the end poisoned nerves necessarily yield less pleasure than healthy nerves. The smoker, deprived of his tobacco, is in distress in exactly the same way as, even if in less degree than, the opium user or alcohol user. He is really a drug addict. He calls for more tobacco to drown the distress which tobacco itself has caused. The net pleasure from all drug addiction is presumably less than zero, even without counting the indirect pains, or losses of pleasure, which come from the bodily and mental injuries and ailments described—impairment of heart or eyes, incapacity to resist tuberculosis, decrease of earning power, beclouding of the mind.

In short, tobacco as a "pleasure" is a delusion and a snare.

The average smoker thinks of his indulgence as in the same class as harmless amusements or pastimes, like the movies or chewing gum. He has a right to know that it is really to be classed with harmful habit-forming drug addictions.

Legitimate recreation is not only permissible but essential as a part of human life. But there is always a tendency for self-indulgence to pass over the indefinite boundary line between legitimate *recreation* and illegitimate *dissipation*, the line which separates wholesome from unwholesome drama, the line which separates an ice cream soda from a brandy-and-soda, or separates a card party from a gambling joint, or separates normal and moral from abnormal and immoral sex life.

We cannot classify human conduct, as a child does, as simply wholly good and wholly bad. Often it is hard to draw the line at all and moderate tobacco using is close to the border line. But we can readily see that it is a step on the wrong side of the line.

(The next and concluding article will treat of the money costs of tobacco.)

Floating Mansion of the President

Concluded from page 11

Oyster Bay, when he effected peace between Russia and Japan. President Roosevelt directed that the Russians be held aboard their ship and that the Japanese be brought on the *Mayflower*. He greeted the ambassadors of the two countries in his cordial manner and after a twenty minutes' conference in the library of the *Mayflower* all was well. The President's yacht carried the House Naval Committee to the Panama Canal in 1912; conveyed Admiral Togo and party to West Point and Mount Vernon in 1911; and has been the means of conveyance of many other notables in her cruises along the Potomac River. In fact, she is equipped to go anywhere at the direction of the President.

Structurally, the *Mayflower* is built of wood, for the most part, and is semi-water-tight. She is 273 feet long, has a beam of 36 feet, a mean draft of 17 feet 4 inches, and has a displacement of 2,690 tons. She is manned by a crew of 165 men, and she has a capacity of 16 4/10 knots. Last year, the *Mayflower* power plant was converted from a coal to an oil burning unit, thus eliminating the smoke and cinders common to ships that consume coal. During the administration of President Harding she was damaged by a fire but repairs were soon effected. She is provided with a barge, operated by a high powered gasoline engine, which is a means of [illegible] veyance of the Presidential party from the *Mayflower* [illegible] dock. This motor boat, which is said to be the [illegible] type in the world, is equipped with a bell, [illegible] light, and compass, and is capable of going [illegible] water at 20 knots, but this speed has never [illegible]

[illegible] gton, of course, is the home port of the [illegible] Off duty, she may be seen on the Anacostia River, docked alongside the Washington Navy Yard. Aircraft constantly soar above this venerable yacht, and the breezes that fan her upper deck make it inviting during sultry days. During the past summer not infrequently Mrs. Coolidge retreated from the White House to this deck to escape the heat wave. Occasionally, she would be accompanied by her friend, Mrs. Frank W. Stearns, and the two would sit on deck and partake of the sea breezes and quietude which are rare elsewhere in the National Capital. The *Mayflower* not only bespeaks the privacy of a mansion and the peaceful environment of a home, but there is a total absence of a military spirit—only four 6-pounder saluting guns on board.

Almanacks of Our Forefathers

Concluded from page 12

Bonhomme Richard, presented by France to John Paul Jones, was named "Clever Richard" in honor of Franklin and his "Poor Richard."

Great works of literature and art are characterized by enduring qualities being powerful in appeal after centuries. Take it in industry the following maxims of Franklin are as good today as they were two hundred years ago:

"If you would have your business done, go; if not, send."

"The eye of the master will do more work than both his hands."

"Not to oversee workmen is to leave them your purse open."

Industry and frugality were virtues much extolled by Franklin. "Necessary Hints to Those That Would Be Rich," written in 1736, was followed 20 years later in "Poor Richard" by a "Plan for Saving One Hundred Thousand Pounds." These are attractive ideas and the suggestions are as valid today as when written by the great American philosopher and scientist, journalist and statesman.

In the preface to his first almanac Franklin perpetrated a somewhat questionable joke upon another almanac producer named Titan Leeds. Franklin announced: "He dies, by my calculation, made at his request, on October 17, 1733, 3 hours, 29 min. P. M., at the very instant of the conjunction of the sun and mercury: By his own calculation he will survive till the 26th of the same month." In the next issue, despite the frantic disavowal by Leeds, Franklin announced the death as predicted, ridiculing the foolish assertions of Leeds that he was still living. After the actual death of Leeds a few years later Franklin published a spirit letter as received from Leeds in which the latter confirms Franklin's prophecy of his death as taking place in 1733. Parenthetically we may remark that the great Swift in 1708 to 1710 played a similar prediction joke upon an Englishman, Partridge, following it up with "An Elegy Upon the Supposed Death of Partridge, the Almanack-Maker," and finally an epitaph for the naturally irate Partridge.

Examine the little almanac with care. Observe the days and the seasons. Observe the signs. Above all do not be enticed into enjoying all the symptoms so delightfully described in the free almanacs as so easily cured by pills and sirups and compounds. Let the mystic symbols tempt you rather to look to the open heavens and the great outdoors. As "Poor Richard" said:

"Many dishes, many diseases.
Many medicines, few cures."

and "He is the best physician that knows the worthlessness of the most medicines."

Some Ups and Downs on the Atlantic

Co

What could be more logical, asked he, than to put her in a place where she would have less leisure and more responsibility? Driving nails would cut down her leisure and taking care not to smash her fingers would increase her responsibility.

"Do you realize," he asked me, "that when one is driving nails he can think of nothing else in the world? He has got to watch that hammer and his fingers all of the time."

Another gentleman eased over toward me in the smoking room began to talk and as rapidly as he could do so, sketched his business career, up to his retirement at the age of 65, taking care to specify each occasion when his sagacity had prevented him from investing in ventures that afterward went wrong. Finally, he accumulated all the money he wanted and decided to retire from business and spend the rest of his life traveling.

"I deeded over to my wife," he said, "a lot of property and when I handed her the deeds said: 'Now here is enough property to keep you going all of your life and as long as you live I don't want you to ask me for another cent.'"

I assumed, of course, that here was another gentleman who had had trouble with his wife, but a few moments later I heard a woman's voice behind us.

"So here is where you are," she said to him. "I [illegible] not know but you had got off the ship."

I looked around and saw a woman about seventy years old. She was his wife. On shore none of these men would have talked to a stranger about his wife or business. On the sea they blabbed like magpies. I [illegible] sure I did nothing to encourage them to talk.

[illegible] thing that may happen to you on the Atlantic, any month of the year, is to run into a storm. On the eastward trip, we ran into one in early June. Or rather, it ran into us. It came up behind us in what was described on the ship's log the next day as a "full gale." Waves 60 feet high struck us between the center and the stern of the ship. The old boat, though it is one of the five largest in the world, went over with each smash until sometimes it seemed as if it would go clear over. [illegible] stayed on deck, clinging to a post, all day, watching [illegible] storm. One had to cling to something to stand. The decks were tilted so that all the furniture in the smoking room and lounge slid across the floor and piled up against the wall. Men and women, thrown off their feet, tried to climb up the floor as they might have tried to climb the roof of a house. Many women had bloody noses and some sprained arms. After the big spill in the lounge, the leader of the orchestra announced that the worst of the storm was over and there would be some music. In less than five minutes he and all of his players were sprawled over the floor with their legs tangled up in their instruments. The storm was at its height for a day, but seven hours after it began to recede I was in the smoking room when this happened: The ship gave a terrific roll. A man who was sitting at a table near me with two women went over backward, turned a complete somersault and came down on his hands and knees—with his chin on the floor—and a heavy chair on top of him. It seemed as if he might have been severely injured, but he got up, rubbed his bald head a moment, ordered another drink and went on talking.

Speaking of drink reminds me to say this: There is a general belief that when American men go abroad they begin drinking as soon as they are beyond the twelve-mile limit and keep it up until they reach home. So far as I know, this is not so. There was plenty to drink, going across and coming back, but no immoderate drinking. I saw nobody who was drunk or even noticeably under the influence of liquor.

Most passengers find their amusement, not in drinking but in walking around the deck, playing shuffleboard and other similar games, and reading. To tell the truth, one fails to see anybody getting much pleasure out of an ocean voyage. People go aboard believing that they are to have a glorious week of idyllic enjoyment. In about twenty-four hours, most of them seem to realize that they are becoming weary of it. The restlessness of the land takes hold of them. They have nothing to do and too much time in which to do it. They begin to count the days until the trip will be over. What else can they do? One cannot enjoy looking at a lot of water forever. It is not worth $300 or $400 to sit around and read magazines six days. Some are always seasick and can't do anything, though if one will look at the sky instead of the water there is no reason why anyone should be seasick. In a little while, he can even look at the water when the ship rolls or pitches.

But something may happen at any moment on the ocean to give one a thrill. One beautiful morning I had breakfasted and gone to the smoking room where in my favorite seat on the top deck at the front of the boat I could get a splendid view of what seemed to be the whole ocean. I was smoking away, thinking of nothing in particular, when suddenly the whistle began to blow. It was unusual for the whistle to blow except at noon, but I supposed it was blowing as a signal to a passing vessel. Almost immediately, however, the ship, which had been sailing a straight course, began to turn sharply to the left. The whistle, too, instead of blowing a continuous blast, blew several blasts. Looking over to where two stewards were standing I knew from their faces that something unusual had happened. I walked over to them and asked them what the blowing of the whistle meant. They said it was an emergency signal, the meaning of which they did not yet know. Descending to a lower deck I met many other passengers who, like myself, wanted to know what the emergency whistle meant. A steward said he understood that somebody had fallen overboard. A half-minute later another member of the crew said he had been informed that somebody had jumped overboard. It turned out that one of the cooks had leaped from his quarters, near the stern. Meanwhile, the big ship continued to swerve to the left until she had described a complete circle when she stopped near the point where the unhappy cook jumped into the sea. The ship remained there half an hour. Then we went on, leaving the poor youth who had traveled with us 1,500 miles in the middle and at the bottom of the Atlantic Ocean.

It was interesting to see how different individuals reacted to the tragedy. One man, whom I had never seen before, rushed up to me while the meaning of the ship's whistle was still unknown and, with his face wreathed in smiles, said: "This will give the low field a chance." Nothing but gambling apparently interested him. Another man, after the ship resumed its journey, expressed sympathy for the cook and said they would make the ship a gloomy place that day. The captain's comment the next morning at breakfast was this: "I should have thought that cook might have been a little more considerate. He might have dropped overboard at night and not spoiled everybody's day."

Sometimes it is a fog that brings everybody to attention. Sailors fear fog more than anything else. It is true that radio and a device by means of which the propeller of a nearby ship can be heard offer much protection, but there is still danger that signals may be misunderstood. When a heavy fog closes down on a ship, most captains cut their speed to half during the day and less than that during the night, and sound the whistle at intervals of a minute. An extra lookout is also sent into the prow. Everybody is glad when a fog is over.

After the rising of a fog, along toward sunset, beautiful cloud views are often presented. I have seen what appeared to be five or six transparent drop curtains of fog, each fashioned in fantastic form, all hanging motionless over the sea. You looked through the six fog curtains as you might have looked through so many transparent curtains of scenery in a theater.

The last night of the trip differs from all the others. There is no selling of pools. The halls are full of trunks. Everybody is preparing to go ashore and is glad of it. The next morning you may see a fishing boat perhaps the first ship you have seen since you left New York. A little later, if your ship is to call at Cherbourg on its way to Southampton, you sight the northern coast of France. You note the quaint homes on the hills of Cherbourg and get your first view of the great breakwater that extends about four miles into the English Channel.

Your ship drops anchor near the breakwater. A French tender comes alongside. You see the French captain at the wheel of the tender—perhaps a short spare, snappy man with black mustache and chin whiskers. Very seriously he takes his job of maneuvering his little craft up to the big one—as well he may. When ropes from the big ship have made the little one fast, passengers and baggage are transferred. You see the young girls go down the plank, eager to get to Paris. For the moment, at any rate, London does not interest them. They want to see the styles.

After an hour or so, you are again off on your journey. You proceed up the English Channel and, in a short time, sight the Isle of Wight. Somebody points out to you Osborne House, which used to be the favorite castle of Queen Victoria, a beautiful palace nesting on a hillside surrounded by shrubbery.

After five hours on the Channel, you sail up the river and are soon at the dock at Southampton. You find the English customs house intelligently organized and effective. You pass through it with no confusion or inconvenience. French customs houses are very different. They are madhouses.

You take a train at Southampton, and after a ride of ninety miles through beautiful country, stop at the Waterloo Station in London. You look at your watch, which you set ahead approximately an hour each night on shipboard, and realize that while it is 7 o'clock in the evening in London—according to "Big Ben" which is just striking—it is only 2 o'clock in the afternoon in New York.

This Is My Own, My Native Land!

Concluded from page 3

red man. His emotions are ever hid behind a stolid face.

So the refusal of this simple native to violate a trust [illegible] him by his father was the reason back of it all. [illegible] some line of reasoning, Long Jim and a few of his faithful followers really believe in their simple way that their ancient land—at least the present south half of the reservation—can be won back to them, by refusing to accept any of the treaty money. They seem to attach considerable importance to the continued drought that has had this land in its grip since the very year it was thrown open to the white settler, back in 1915.

From what I can gather, there are some of them that look on it as an act of Providence in driving the whites from the drought-stricken land, for, although they have suffered along with the rest, out of the hundreds of white people that made their homes on the reservation there is but a mere handful left.

Little occurrences which had to do with the Indians of this vicinity that I had wondered over in the years I had been here were suddenly made plain. Chief among them was the controversy over the property of Long Jim that he had inherited from In-na-mo-sech-ee Jim, his father. Located along the north side of the townsite of Chelan, it soon became valuable when that place developed into a mecca for the tourist, camper, and fisher folk, bound for the snow-capped Lake Chelan country beyond, the Switzerland of America.

For years this land was the bone of contention between a company of real estate men, the Indian Department, and Long Jim. It is reported that he (Long Jim) could at one time have received some forty thousand dollars for his interests; but he refused it.

The controversy dragged along, punctuated with lawsuits that ate into its vitals. Taxes accumulated until Long Jim had to borrow three or four thousand dollars from his people with which to pay them.

Today, his interests in the pretty city at the foot of the lake have disappeared, save for a long winding grade that leads away from Chelan to the north. It is called Long Jim Hill.

During all this time there were other incidents in which the Indian took a vital interest, which proved his spirit was in no wise broken, and that he was holding inviolate the pledge he had made his father. One of them was the act of the state of Washington in deeding to the State Historical Society a ten-acre tract of land at the mouth of the Okanogan to commemorate the place where the Stars and Stripes were first flown in the state.

Long Jim contested this, fearing that it would be the forerunner of further donations and that improvements being made would rob him of the free land that stretches unfenced, away in the distance.

Though the deed was made the land remains very much the same as it was, save for a 112-foot flag pole that Dan Gamble brought from the top of the mountain with his six-horse team, and a monument of boulders erected by the people of Brewster when they held a centennial celebration there in 1911.

When the present south half was opened, Long Jim fought it with every means at his disposal. His efforts were in vain. The whites came in with a rush, but some of Long Jim's people had taken up allotments to the north of him, and the government laid out a great governmental townsite to the east, and surveyed it into streets, boulevards, alleys and sites for wharves on the broad banks of the Columbia River.

Long Jim viewed this with much concern. The building of a city there would mean his moving away from the mouth of the Okanogan, one of the cherished meeting places of his father's people. But he did not have to worry long. A shack or two was built, the owners held out until they had eaten up their initial stock of provisions, then they moved on, abandoning their embryo establishments to the inevitable pack rat.

With the untillable, tumbled hills stretching to the eastern horizon, the Columbia to the south, the Okanogan on the west, Long Jim rests fairly secure in his ancient domain, made doubly so by blocking the attempt of the city of Brewster to span the Okanogan with a bridge.

The only available site was one that encroached on his land. No amount of argument or bribery could shake the stand taken by Long Jim. Let anyone appear along the newly built road leading to the proposed bridge si and the first object to appear across the river wou the watchful Indian, generally on a horse. Sho cross the stream, Long Jim would meet water's edge. That is as far as they got The road is nearly effaced by the pas

I suppose my Indian friend has vi satisfaction more than once.

Life has been full of misfortune Long Jim. His two sons were taken a of the red man—tuberculosis. A fe last son was going to school in Brews stopped. I asked Jim the reason why. ever he replied:

"Sick now; by-by mamaloose (die).

It was not long until the potlach (funeral) was announced. It is an ancient custom of the Indians to give away all the belongings of the deceased to their personal friends. Cyril Gamble, a white boy, was one of the invited guests. His gift, if I remember, was a pair of beaded moccasins.

The only surviving offspring of Long Jim is his seventeen-year-old daughter, a healthy, fine-looking girl who this autumn will enter her first year in high school. She bridges the gap between the long ago of the Indian and the present day, and may adjust herself to changing conditions and preserve her race from extinction.

Well, What's All This About the Newspapers?

Concluded from page 2

men, I don't believe anybody here knows anything about this."

The meeting broke up in laughter and song. We all agreed that it was more or less hopeless. The newspapers had failed us. Every mental carburetor was flooded.

Who is to blame for this appalling literary waste, which, if allowed to go on, will eventually swallow us all up?

I do not know. I am not a sociologist, a psychologist nor political economist. The facts I have given are indisputable, and easily verified out of our common experience.

As I see it, the besetting sin of our age is lack of restraint, and this bears the same relationship to our national mentality that waste does to our material affairs. When we put no restraint on our minds, the result is shown in material extravagance.

To overcome the complex machinery of modern life, constantly growing more exacting and bewildering, we need clear heads, and clear heads require wholesome recreation and entertainment of the right kind. We dope ourselves with headlines, revel in the unrealities of sensationalism, all the time not realizing that, if we restrained our mental adventures and sought within ourselves the spiritual release which comes from proper moderation and self-discipline, we would then shortly become what our forefathers intended us to be—a really free people.

The Motor-Car Ramp in Great Britain

English Publicist Analyses Mr. Snowden's Recent Free Trade Victory

By R. L. OUTHWAITE

THERE recently fell to the lot of the Labor Chancellor of the Exchequer, of Great Britain, a task, in itself a test of political courage, but peculiarly so in the case of a Labor Finance Minister. During the war a Liberal Chancellor of the Exchequer had imposed duties of 33 1/3 per cent on a range of "luxury" imports to retard their importation. In doing so he breached the Free Trade policy of Great Britain. The 33 1/3 per cent duty on imported private motor cars afforded Protection to the manufacturers. They claimed that the increased output of their factories was due to the duty and that removal would mean the discharge of a large percentage of their workers to join the ranks of the unemployed who already number more than 1,000,000 persons.

The Protectionists can never hope again to have so favorable a battleground as this. An industry expanding from natural causes, operating under Protection withheld from those producing its raw material and the latter thus obtainable in a Free Trade market, together with vast unemployment exploited by the Conservative Protectionist party and press. The duties were due to lapse on last May 1. The Chancellor of the Exchequer provided in his budget statement for their extension until August 1. The leader of the Conservative party moved a vote of censure condemning their abolition and this was defeated on May 13, by a Labor and Liberal vote of 317 to a Conservative Protectionist vote of 252, a Free Trade majority of 65.

The result of the raging propaganda of the British motor manufacturers has been to expose to the public gaze the inherent inefficiency of their methods of production. The *Economist* pointed out that a [illegible] was coming in the motor-car trade and wrote:

"The fact of the matter is that a number of small cars today are being sold at actual cost price, or only very slightly above it . . . . The idea is to try to squeeze out many of the other makers so as to leave the small car market in the hands of only a few makers . . . . Some of the firms are in a very precarious position, and nothing but a miracle can save a good many from closing down within the next few months."

The *Daily Herald*, Labor, noted the slump in the shares of motor-car concerns between the end of 1919 and the beginning of this year.

"Harper and Bean's ordinary shares during this period declined from 21s 6d to 1s 3d, and their Preference shares from 18s to 1s 9d. Together these reductions represent a loss of £4,107,551. Austin Motors have lost upon debentures and shares £3.638,880. Crossley Motors Ordinary stood at 32s 6d four years ago. At the beginning of this year they were 5s. Loss to shareholders, £1,515,195. Other such losses are: Leyland Motors, £1,457,500; Wolseley Motors, £1,433.395; Vauxhall Motors, £619,401.

So much for the motor car industry under Protection of 33 1/3 per cent and producing cars at a price that only the few can afford to pay.

The Protectionists have throughout been hampered because they could not claim that the motor-car industry was threatened by the importation of foreign cars, the product of cheaper labor—their stock-in-trade argument. The common knowledge that the cheapest car in the world is made by highest paid labor robbed them of this appeal. It is not too much to say that this fact largely contributed to the maintenance of the Free Trade policy of Great Britain by having shown that cheap production is not a matter of cheap labor.

As one Free Trade member asked: "How is it that the honorable members opposite are afraid of competition from the United States of America, because in that country the wages paid by the motor industry are very much higher than the wages paid in this country." There was no reply.

The Path of Protection

CAPTAIN WEDGWOOD BENN, D. S. O., a Liberal Free Trader, referred to a sinister aspect of the agitation for Protection with convincing candor:

"I am speaking about the lobbies of this House, and I am referring to the change that has come over our political campaigns in connection with this sort of debate and this sort of duty. We are constantly being pressed by people who come here not for grievances to be redressed, not for some public interest to be attended to, but because they want something done which will put money in their pockets. Men who in the old days thought of nothing but their customers and pleasing their customers think now of nothing but wheedling members of Parliament and nobbling Ministers. People, who in the old days thought that the secret of success was to give better value for money, say today, 'If we can get a tariff, better value is of no account.' Their object is not to promote the public interest but to manipulate divisions in the House of Commons.

"That is a complete change, and a very evil feature. I cannot summarize this point better than in the words of a Tory of Tories, the Noble Lord who sits for the University of Oxford (Lord Hugh Cecil), who said: 'Protection will lead to the corruption of our public life as it has led to the corruption of the life of other countries. The purity of our public life is the lifeblood of Europe. If Conservatives go in for Protection, I will have nothing to do with such an apostate party. If they determine to travel down the path of dishonor and Imperial ruin, I will wash my hands clean of so great a crime.'"

Mr. Snowden, in his speech in reply to Mr. Baldwin, referred to the tactics of the Protectionist manufacturers who were getting petitions signed by their workers, largely girls and boys, for the retention of the duties under virtual duress. He referred in scorn to the arguments used to create the belief that vast unemployment would result from the abolition of the duty. He said: "One employer in the motor industry has virtually made himself leader of this campaign against the repeal of the duties. He has made himself responsible for the statement that if these duties were repealed, a million men will be thrown out of employment and four million more will be indirectly affected."

Mr. Snowden then proceeded to point out that this employer claimed to have turned out 30,000 cars last year or half the British output. He had claimed to employ "directly and indirectly, 40,000 men. The British Motor Car Manufacturers' Association has given me the number of men actually employed by this man. It is not 40,000. It is 4,949."

Mr. Snowden then pointed out that: "The wages bill of the whole car production of this country last year was £13,000,000" and, says the employer already mentioned, "there are 4,000,000 men employed in the production of this output. Therefore, their average wages are £3 a year! . . . . The Board of Trade inform me that it would be a full figure to take 200,000 men as the total number employed in the motor-car industry and allied trades of this country, that is, those who are directly employed in the production of private motor cars. It takes that number to produce 62,000 cars."

Mr. Snowden concluded this examination with the remark: "I will now pass from all this agitation, which one of the leading motor-car manufacturers referred to as 'the colossal humbug of the press campaign.'"

After having had a period of Protection which Mr. Snowden showed had taken £30,000,000 out of the pockets of the British taxpayers at the customs, the net result has been that in "1913 we exported more motor cars from this country than we did in 1923."

It is now to be anticipated that the British motor-car producers, after this exposure of their "colossal humbug," will be compelled to reorganize their methods and produce a car at a price that local millions who want cars can afford to pay, and which like other British products will be able to find a place in the markets of the world.

The Silo That Looks Like a Medieval Tower

ON THE old Green Bay Road, in the country not far from Milwaukee, there stands a unique landmark in the form of a silo which has been converted into a medieval tower. The tower is modeled after those of Chartres in France, and it stands at the entrance to the farm belonging to Clarence R. Falk, known as "Ye Old Apple Tree Farm."

The tower has just been recently completed, and that no detail may be lacking ivy is being planted at its base. Entrance to the tower is gained by a massive hand-hewn oak door, bound in wrought iron, and the semicircular arched doorway is surmounted by a keystone inscribed with the date in the manner of the Middle Ages. A wrought-iron lantern of quaint design is hung on the wall on the left side of the entrance.

Nothing is omitted to give the touch of authenticity to the structure, and so a leaded glass window has been inserted in the lower part of the tower. On this window there is a representation of the coat of arms of the city of Nuremberg, and suspended near it is a lamp of antique pattern which was designed and executed by Cyril Colnik, of Milwaukee.

Just within the entrance are oak benches of massive construction, one of which was made by Mr. Falk himself of lumber taken from the old barn that stood on the same spot. The impression gained on entering is distinctly that of the days of old when knights were bold and ladies were gay as well as beautiful. Part of the furniture consists of hand-hewn stools and a table. In the back wall is a window which Mr. Falk brought all the way from Nuremberg.

But above all the walls of the tower are hung with armor and relics of the chase. No medieval tower or castle or keep would be complete without these trophies suspended here and there along the interior of the massive walls. One of these, which is typical of the rest, is a shield with spears and horn that, as has been observed, might have been used in the time of Siegfried and the Nibelungen.

The whole effect, both without and within, is pleasing in the extreme, and the idea is one well worthy of imitation, for there is no reason why many objects, which are in themselves unsightly, should not be converted into something more pleasing to the eye and educative to the mind. Some landscapes, in some respects very beautiful, sadly lack that picturesque touch which artists love so well, and if silo towers, now so thickly scattered over some parts of the country, can be made to look like something not quite so uncompromising as a receptacle for cattle feed, there is no reason why this should not be done.

There is no reason why any particular design should be adhered to in the planning of such converted structures, or that any two of them should be alike. They may conform in their main features to what a silo tower should be and still possess that touch of Old World beauty which redeems them from being mere objects of utility on the farm, but something that will give character to the landscape, and individuality to the farm itself. A farmer endowed with the spirit of reverence and admiration for the handicrafts of the Middle Ages is something more than a tiller of the soil.

Above—Modeled after the towers of Chartres, France, this rebuilt farm silo at the entrance to Clarence R. Falk's Ye Old Apple Tree Farm forms a unique landmark on the Green Bay Road. Recently completed, the tower will present a different appearance in the next few years, as ivy will be planted at its base and trained to climb the walls.

At left—Glimpse through the open door, showing the hand-hewn stools and table. In the back wall is seen a window which Mr. Falk brought from Nuremberg.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Even though retired, John J. Pershing remains "General of the Armies." He leaves the active list without curtailment of the pay he last drew and in case of an emergency the general could be, and no doubt would be, immediately called up for active service, thereby automatically resuming his rank as general of the armies.

A Dominion government geologist is sinking a deep shaft in the Athabasca tar sands of Alberta to ascertain the extent to which the oils penetrate the sands and also the depth at which evaporation ceases. It is believed deeper tar sands are more valuable.

Canada has one mile of railway to every two hundred and twenty persons, a larger mileage in proportion to population than any other country.

Warren Pershing, son of John J. Pershing, is attending a school at Rolle, Switzerland, on the shores of Lake Geneva, conducted by a Swiss headmaster. He has been sent abroad to ground him in foreign languages.

In a western town there is a sign reading as follows:

4076 people died last year of gas.
39 inhaled it;
37 put a lighted match to it;
4000 stepped on it.

There are 5,000 orphans and semi-orphans of veterans of the World War in the United States.

The color of the Red Sea is due to the great number of minute warm-water plant animals that live in it.

The world's largest Bible, every word of which was written by hand, has just been completed by the Maine Bible Society. The volume, which weighs eighty-eight and one-half pounds, was produced to attract wider attention to the Scriptures. It is the result of the combined efforts of 1,607 persons during the past year.

Three men in the west end of London, formerly of a high station in life, but now in reduced circumstances, have opened a school that has for sole purpose the teaching of men to dress well.

America has a property loss of $1,400,000 and a record of 40 deaths caused by fire daily.

A cement road for automobiles only, and without a speed limit, has been officially inaugurated by the King of Italy. The road extends thirty miles from Milanvarese, and later will be extended to Lago Maggiore near the Swiss border.

Life is cheap in America where we have seventeen murders for one in England.

Tailors of London are up in arms because they see "badly dressed husbands accompanied by extravagantly dressed wives, while shabby business men dictate letters to stenographers wearing the latest thing from Paris." Their theory is that the woman spends so much of the family income that there is nothing left to dress the man.

The new edition of the Almanac de Gotha carries one line referring to the Romanoffs, the former reigning family of Russia. Before the war, six finely printed pages did not suffice for the annals of this family.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

As a means of stimulating Sunday school attendance and as a convenience to late risers, the Highland Men's Bible Class, of the Highland Presbyterian Church, Pittsburgh, has Sunday morning breakfast served in the church basement prior to the opening of the class meeting. Hot ham and eggs are on the menu.

A plague greatly resembling the dreaded hoof-and-mouth disease has been discovered among deer in Klamath County, Oregon, near the California line.

Ten thousand Jews, bearing American consular visas and tickets calling for transatlantic transportation, are stranded in Cuban, German, English, Dutch and Rumanian ports, an emergency committee headed by Louis Marshall and Rabbi Stephen S. Wise asserts, in appealing for a $500,000 fund for the relief of the "refugees."

The radiocast peddler in Berlin permits the customer to clamp on a headset from his portable radio operated from a pushcart.

Grace Darling, the heroine of the Farne Islands shipwreck, has one of the most beautiful tombs [illegible] North England. It is in the churchyard of [illegible]urch, Bamburgh, well placed in the [illegible] the home in which she lived nor [illegible] which she died has any mark upon its association with the heroine.

There are no saloons in Labrador.

Despite the belief that lightning never strikes twice in the same place, the Eiffel Tower in Paris has been struck many times without damage.

The termite, or "white ant," forms the basis of various kinds of food in tropical countries. Pounded into a thick paste, these insects taste not unlike almond icing, and are regarded as a great delicacy.

"I wish that we could send to Russia, for a cure, every Red in America, and make him live there until he could learn by actual experience what Emma Goldman and Bill Haywood have learned about the relative blessings of Bolshevism and personal liberty under the Constitution of the United States."—*Henry J. Allen,* former governor of Kansas.

The people of Australia are ninety-seven per cent British.

French engineers plan windmills to relieve the country of its heavy burden of payment for imported coal. They would have the windmills generate electric power.

The Training Committee of Boston University insists that all girls who go in for sports this year must not smoke and must get at least eight hours' sleep each night. Six infractions of the sleeping rule will be punishable, but there must be no backsliding where tobacco is concerned.

Bright Angel Trail, at the Grand Canyon of the Colorado in Arizona, will be offered for sale at public auction in Flagstaff, Arizona, on October 20. The United States Government will be a bidder, with an offer of $100,000.

Roger Bacon, who lived and wrote seven centuries ago, predicted "machines for navigation without rowers, cars without draft animals, flying machines." Because of this statement he was adjudged a sorcerer and thrown into jail.

South Africa wants to cut its own diamonds, instead of sending them to Rotterdam and Belgian cities.

In making shark fin soup, the Chinese boil the fins and otherwise treat them until they take on the appearance of fan-like flakes and filaments of pure gelatine. The eyes of the shark, after they are boil[illegible] lose their outer covering, and the residue becomes quite hard and has a sort of shifting light in its texture. These shark eyes are then mounted on pins or other forms of jewelry and present an unusual appearance.

A glacial mud flow, originating on the southeast side of Mt. Shasta in Northern California, was caused by the exceptionally dry season of 1923-24. There was very little snow deposited on Shasta last winter; the sun melted the glacier to such an extent that the water came down in torrents from high above timber line, bringing down great quantities of boulders, mud and debris, twenty feet deep and a quarter of a mile wide. It finally emptied into the McCloud River and on into the Sacramento River, coloring the water for more than 100 miles below the confluence of the streams.

A bill was passed at the last session of legislature in Maryland which gives the women the right in that state to say merely that she is "over twenty-one" when registering to vote. She will not be compelled to give her correct age unless she chooses.

More than 3,700 books have been written on the Einstein theory of relativity, according to Professor Maviece Lewt, of the Louva New University. Germany holds the record with 1.435 publications, followed by France, Italy, Holland and America, the last numbering 128. This does not include newspaper and magazine articles on the subject.

America's tax burden in the year 1923 was $755 000,000 heavier than the year preceding, and in ten years taxation has increased more than $5,500.000,000. Total taxes in 1923 were $7,716,000,000 against $6,961,000,000 in 1922.

There are two separate languages in China—the written and the spoken—and only a few of the inhabitants can read. Consequently, there are no half-educated people in China. The Chinaman is either a scholar or a coolie.

CHRONICLER OF THE NEGLECTED TRUTH

Our Fundamental Purpose

The real fundamental purpose of THE DEARBORN INDEPENDENT is to serve as a medium for the dissemination of sound ideas.

This publication does not cater to its readers, but honestly trys to present for discussion those problems which require public attention.

By stimulating thought and discussion among its readers it achieves the main thing necessary to correct existing evils.

Subscriptions will be accepted by any Ford Dealer, or may be mailed direct by means of the accompanying form.
